Resources Department, Sheboygan County  
Thomas A. Wiza ..... Director of Engineering and Public Works,  
City of Cedarburg

Special acknowledgement is due Mr. Martin A. Aquino, Environmental Manager, City of Milwaukee Department of Public Works; Mr. Mark Baran, former Interim District Conservationist for Ozaukee County; Ms. Marsha B. Burzynski, Program and Planning Analyst, Wisconsin Department of Natural Resources; Mr. David E. Carpenter, retired Director of Planning and Development for Dodge County; Ms. Diane M. Georgetta, former Coordinator, Town and Country Resource Conservation and Development, Inc.; Ms. Elizabeth L. Gillen, Acting District Conservationist for Ozaukee County; Ms. Shannon K. Haydin, former Director, Sheboygan County Department of Planning and Resources; Ms. Judy Jooss, Representative, Town and Country Resource Conservation and Development, Inc.; Mr. Charles J. Krohn, former Regional Water Leader for the Wisconsin Department of Natural Resources; Mr. David Lynch, retired Ozaukee County Conservationist; Mr. Gary A. Mick, retired Director Milwaukee County Environmental Services; Mr. Stephen Poloncsik, Senior Staff Engineer, U.S. Environmental Protection Agency; and Ms. Gretchen Sawtelle, Executive Director, USDA Farm Services Agency, all of whom served on the Committee during much of the planning process.

**PLANNING REPORT NUMBER 50**

**A REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE  
FOR THE GREATER MILWAUKEE WATERSHEDS**

Part Two of Two Parts  
Appendices

Prepared by the

Southeastern Wisconsin Regional Planning Commission  
In Cooperation with the  
Milwaukee Metropolitan Sewerage District,  
Wisconsin Department of Natural Resources,  
and the  
U.S. Geological Survey

The preparation of this report was financed in part by the Milwaukee Metropolitan Sewerage District and by the Wisconsin Department of Natural Resources and the U.S. Environmental Protection Agency under the continuing water quality management planning program conducted cooperatively by the Department and the Regional Planning Commission.

December 2007

[Amended May, 2013](#)

## **Appendix A**

# **PUBLIC INVOLVEMENT PROGRAM SUMMARY: REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE FOR THE GREATER MILWAUKEE WATERSHEDS**

### **BACKGROUND AND INTRODUCTION**

This document summarizes the public involvement efforts during the preparation of the Southeastern Wisconsin Regional Planning Commission (SEWRPC) regional water quality management plan update for the greater Milwaukee watersheds.

The water quality planning public involvement program and its activities were designed to be consistent with the SEWRPC Staff Memorandum entitled, “Public Participation Plan for Transportation Planning Conducted by the Southeastern Wisconsin Regional Planning Commission,” 2004, and as amended in 2007. That memorandum serves as a general guide for Commission public participation programs. In this respect, policy statements from the memorandum regarding public notification and access, obtaining public input, incorporation of public input, evaluation of the public involvement process, engaging minority and low income populations, and compliance with the Americans with Disabilities Act are not repeated herein. However, they are considered to apply in like spirit as public involvement in water quality planning attempted to be open, ongoing, valued by participants, and valuable to the planning process.

The Commission’s public involvement goal during the course of the study was to ensure early and continuous public notification about regional water quality planning activities, provide meaningful information concerning such work, and obtain participation in, and input to, regional water quality planning efforts. In short, public involvement was considered essential to the conduct of the plan update.

The public involvement activities, which were carried out in collaboration with the University of Wisconsin-Extension, were focused through the use of advisory committees, cooperative actions with other related ongoing public involvement, and complementary public involvement with respect to separate planning efforts and watershed educational programming. An important consideration was to carefully coordinate and integrate the public involvement activities for the regional water quality management plan update with similar activities that were undertaken as part of the Milwaukee Metropolitan Sewerage District (MMSD) facilities planning program and the Wisconsin Department of Natural Resources (WDNR) basin partnership ongoing programs.

MMSD and the Commission developed and conducted a joint public involvement program for a number of key purposes, including joint activity planning and public events, several shared committees, and preparation of

informational and educational materials that both programs could utilize. Examples of the latter included “State of the Watershed” booklets and pictorial tour maps, as well as newsletters, produced by MMSD and maps for public display and informational purposes produced by SEWRPC, all under what became known as the Water Quality Initiative. Such materials were very well received and clearly benefited both planning programs in the interagency effort.

The roles of each agency in the cooperative watershed approach to water quality and facilities planning were described in a Memorandum of Understanding which supported the public involvement program. A methodology for coordinating the public involvement programs was initially set forth, largely in parallel fashion to the components described herein. Approaches were evaluated as the planning programs unfolded and public involvement activities were conducted, in an attempt to be responsive as the programs evolved.

## **ADVISORY COMMITTEE STRUCTURE**

Broadly-based and representative advisory committees formed a fundamental type of public involvement. Three types of advisory bodies guided the regional water quality management plan update, one of a technical nature, one to provide intergovernmental coordination and policy advice and assistance, and one citizen-based. In addition, ongoing participation in an oversight committee for the coordinated regional water quality management update planning program and the MMSD facilities planning program—involving the WDNR, MMSD, SEWRPC, and the MMSD consultant project manager—as well as public involvement staff coordination and ad hoc committees for event planning were considered important adjuncts to public involvement activity. An example of the latter was the committee assembled to plan the annual “Clean Rivers, Clean Lakes” conferences described in a following section.

The MMSD also established an advisory body to help guide preparation of the 2020 Facilities Plan, known as the Technical Advisory Team. Commission staff frequently attended and regularly made presentations to this additional public body, as listed in Appendix A-1, along with many other presentations pertaining to the public involvement components described below.

### **Technical Advisory Committee**

The SEWRPC Technical Advisory Committee (TAC) was an integral part of the organization of the study. The composition of this Committee included broad representation, including technical staffs, academia, business, agriculture, and community and environmental organizations, among others. The Committee was designed to represent the entire study area and functioned in a manner similar to the technical advisory committee which guided the preparation of the initial 1979 regional water quality management plan. Included in its purview was a review of the draft planning report preparation and related technical work at important milestones, as well as review of the draft technical report.<sup>1</sup> The Committee also was asked to review and provide advice on important technical matters and decisions. Included were review and updates at key junctures of public involvement program activities. It was important that the TAC had overlapping membership, as appropriate, with the concurrent MMSD Technical Advisory Team.

The TAC met continually during the course of the study, conducting a total of 21 meetings. The committee’s membership is shown on the inside front cover of this report, and official minutes are kept on file at the Commission offices.

The TAC had a parallel modeling subcommittee constituted to review the scope of work for both the watercourse and the harbor and nearshore modeling project elements, as well as important model development and operational milestones. Due to the technical complexity and level of detail, this subcommittee focused on water resources modeling issues. The members of the modeling subcommittee are listed in Appendix A-2.

---

<sup>1</sup>*SEWRPC Technical Report No. 39, Water Quality Conditions and Sources of Pollution in the Greater Milwaukee Watersheds, November 2007.*

### **Watershed Officials Forum**

In addition to the Technical Advisory Committee, a Watershed Officials Forum was organized to be periodically briefed by Commission staff and to provide feedback and input from the units and agencies of government on a watershedwide basis. This forum was one of the shared advisory bodies utilized by both the Commission and MMSD. The invited membership included the chief elected official from every county, city, village, and town within the watershed area, plus their designees (often planning or engineering staff or an alternate official). Also included were County Board Chairs and County Administrators, where applicable.

The Watershed Officials Forum (WOF) was designed to be called together for briefings by the MMSD 2020 team regarding facilities planning or by SEWRPC regarding regional water quality planning, or for both purposes. As meetings were scheduled, the subject matter was described so that the invitees could effectively participate in their areas of concern and interest. Thus, meetings selectively focused on the MMSD service area, the entire watershed areas, selected watersheds, or a broad spectrum. This allowed the invitees to target their involvement if they so chose. The WOF began its involvement in the planning process with multiple meetings during June and September 2004. Selected materials pertaining to the recruitment of watershed officials, and the initial Forum meetings are shown in Appendix A-3.

During the initial WOF meetings, attendees expressed the concern that comprehensive, or “smart growth,” planning efforts were beginning to tax the time of local officials, while recognizing that comprehensive plans needed to address issues germane to the interagency water quality planning. As a result, the officials requested that water quality planning input and updates occur in the context of county comprehensive plan meetings and correspondence and through coordination with local staff. Thereafter, the Commission provided periodic updates to local officials during county comprehensive plan meetings (see Appendix A-1). This coordination with “smart growth” planning had the additional advantage of becoming an opportunity for interested citizens and local officials to provide input on the regional water quality management plan update. It was seen to be mutually beneficial in relieving inadvertent competition for participant time in multiple meetings, when water quality management planning updates could be included on comprehensive planning committee agendas. In addition, targeted correspondence was sent to watershed officials, for example, during the development of plan objectives and to encourage attendance at major public events during the planning program.

### **Citizens Advisory Council**

Another shared advisory body, the Citizens Advisory Council (CAC), was formed in cooperation with the MMSD 2020 facilities planning program to actively involve private citizens, businesses, special interest groups, and industry representatives in the development of the planning studies. The Council functioned as a representative body of concerned and diverse citizens. The members of the WOF were asked to help recruit the CAC members, including business and neighborhood or community representatives.

The CAC primarily met at the MMSD headquarters in Milwaukee. However, members were also invited to participate at other meeting locations, based upon watershed areas, particularly during the solicitation of ideas for development of plan objectives. During this process, members could choose to attend at one or more of the locations. Opportunities to discuss all of the watersheds (Kinnickinnic, Lake Michigan Direct Drainage Area, Milwaukee, Menomonee, Oak Creek, and Root) were provided in most meetings, and attendees freely commented on regional or watershedwide issues. However, even meetings designed to specifically elicit more localized watershed comments largely generated broader comments. The public involvement program iteratively adapted to this phenomenon in the formulation of planning objectives as described below.

The CAC met a total of 28 times during the study, with minutes and other records on file at MMSD headquarters. Commission staff presentations to the CAC are listed in Appendix A-1.

## **ADDITIONAL COOPERATIVE ACTIONS AND RELATED ONGOING PUBLIC INVOLVEMENT ACTIVITIES**

As noted initially, and explained in regard to advisory committees, it was important to carefully coordinate the public involvement activities of the regional water quality management plan update with related activities of the MMSD facilities plan and the WDNR basin partnerships. The following subsections provide examples.

### **Supplemental Advisory Bodies**

The MMSD provided regular updates to its Intergovernmental Cooperation Council (ICC) particularly with respect to facilities planning, but also on the regional water quality management plan update. This council is comprised of representatives from the District's member or contract communities. While updates were given by primarily MMSD staff, Commission staff also presented material in ICC meetings, as indicated in Appendix A-1.

Though not a formal part of the study's committee structure, input was also sought from the Milwaukee River Basin Partnership. Members of that Partnership serve on the Technical Advisory Committee, and Commission/UW-Extension staff periodically appeared on the agenda of Basin Partnership meetings to provide information and solicit input on the areawide plan.

At several junctures during the study, agricultural interests in the Greater Milwaukee Watersheds were convened, with the assistance of the WDNR staff, largely for technical purposes in plan preparation, but also as part of the public involvement program. Invited to an initial group meeting in June 2005 were county conservationists, NRCS District Conservationists, UW-Extension agricultural educators/agents, Farm Service Agency executive directors, county planning directors, and oversight agency staff, some of whom served on the TAC. Thereafter, smaller and specific county efforts continued. The effort was designed to share the status of the water quality plan update, discuss the availability of rural data, project a stage of implementation of agricultural nonpoint source management water quality standards (Chapter NR 151 of the *Wisconsin Administrative Code*) for modeling of future conditions, and to consult on plan recommendations related to agricultural interests. Attendees were also invited to relay any suggestions of persons having upstream rural interests who might participate in WOF or CAC meetings, with the intent of broadening involvement in the nonurban portion of the Greater Milwaukee Watersheds.

### **Development of Plan Objectives**

The development of objectives provides a good example of coordination and cooperative actions to achieve multiple needs. The Citizens Advisory Council provided to the joint planning programs a list of many hundreds of comments, issues, actions and measures considered important to the future of water resources in the Region. The Commission then matched these items, and subsequent feedback, with the objectives developed in comprehensive watershed management and land use planning programs that had been reviewed by advisory committees in the past. In addition, WDNR watershed and basin planning objectives, as well as those from other relevant studies, were reviewed. Objectives were added based upon this process, then revised and refined based upon further review by the CAC, watershed officials, and the public. Meanwhile, MMSD used the common advisory bodies, meetings, and input, to prepare a parallel set of objectives which were complementary to the Commission's and which served the needs of that agency's facilities planning. The process of formulating objectives is described more fully in Chapter VII, and the principles, objectives, and standards that guided the planning process are set forth in Appendix G of this planning report.

## **KEY PUBLIC INVOLVEMENT ACTIVITIES AND EVENTS**

Other major public involvement activities were developed and employed as the regional water quality management plan update proceeded.

### **Website**

The Commission's website was augmented in 2004 to contain detailed information about the ongoing water quality management planning effort. That information included an overview and details regarding the planning

effort, background information, orientation maps, a public involvement summary, plan chapters, TAC meeting materials, committee roster, notices of conferences and other public events, helpful links, and means of commenting/specific contacts. A link to MMSD's website and Water Quality Initiative (WQI) events and materials was quite important during the course of the study. There, additional background, watershed booklets, newsletters, Citizens Advisory Council materials, and conference presentations were maintained and made available. The Commission website's link to the District's thus became a key example of complementary rather than duplicative efforts. Excerpts from the SEWRPC website are shown in Appendix A-4.

### **Conferences**

Major water quality planning conferences were conducted in 2004, 2005, 2006, and 2007 to meet multiple public involvement needs. Called "Clean Rivers, Clean Lakes," these events drew between 270 and 420 total participants each year, and they tracked plan progress from a major public "kick-off" through presentation of the recommended plan. As mentioned above, additional agency and organization sponsors were brought into the conference planning, and the event also helped fulfill a multi-regional, multi-state initiative called the Lake Michigan Watershed Academy sponsored by the U.S. Environmental Protection Agency during 2004 and 2006. Conference presentations were typically posted on the Water Quality Initiative page of the MMSD website, linked to the SEWRPC website. Registration brochures containing agendas for the four watershed planning conferences are shown in Appendix A-5.

### **Public Informational Meetings and Hearings**

At three major junctures during the study, the public was invited to at multiple locations for informational meetings with comment opportunities. The first two series of public meetings were conducted in conjunction with MMSD under the Water Quality Initiative; and the third series of meetings, which was scheduled and held by the Commission, also contained a formal public hearing for the regional water quality management plan update for the greater Milwaukee watersheds. Staff representing MMSD and SEWRPC were present at each of the meetings. All of the meetings contained an open house component with display materials so that attendees could speak individually with staff, comment or have their questions answered individually, and come and go as convenient. Appendix A-6 outlines the meetings by series, date, and location.

The first series of public informational meetings was held in September 2004 to seek public input early in the planning process relative to initial inventory findings and draft goals and objectives. The meetings locations were Bayside Middle School in Bayside, the United Community Center and Washington Park Library in Milwaukee, and Longfellow Middle School in Wauwatosa.

The second series of meetings was held in March and April 2006 to get feedback on the preliminary alternative plans. The meeting locations were the Italian Community Center, United Community Center, and Mother Kathryn Daniels Conference Center, all in Milwaukee, Longfellow Middle School in Wauwatosa, and the North Shore Library in Glendale.

The third set of meetings, also containing a public hearing on the Commission's recommended plan, was held in October 2007. These meetings additionally contained a formal presentation related to the draft plan and an opportunity to dictate a comment to a court reporter. The meeting locations were Gateway Technical College in Racine, the Downtown Transit Center in Milwaukee, and Riveredge Nature Center near Newburg. Distribution of the notice of public informational meetings/hearings occurred to all chief elected officials and clerks in the 9 counties and 88 municipalities in the study area; the Wisconsin Farm Bureau Federation office in each respective county, the Milwaukee River Basin Partnership, and the Root-Pike Watershed Initiative Network; the MMSD Technical Advisory Team; the MMSD/SEWRPC Citizens Advisory Council; and the SEWRPC Technical Advisory Committee and Modeling Subcommittee. Appendix W contains the announcement of these meetings/hearings and provides further details and documentation of comments received. The meeting announcement was published in the following newspapers: El Conquistador (Milwaukee area), The Reporter (Fond du Lac), The Insider News (Racine area), the Milwaukee Courier, the Milwaukee Journal Sentinel, the News Graphic (Ozaukee County), The Journal Times (Racine), The Sheboygan Press, The Freeman (Waukesha), and the Daily News (West Bend).

### **Other Public Forums**

Beyond the presentations and information exchanged in the aforementioned committee meetings, conferences, public informational meetings, and other events, other forums were utilized to ensure that all citizens had an opportunity to be informed about the water quality planning program, and to offer comments.

### ***Testing the Waters Tours and Workshops***

Testing the Waters is an inter-organizational consortium which is designed to educate high school students and their teachers about integrated water quality issues. Coordinated by the Riveredge Nature Center, which is located centrally in the Milwaukee River Watershed, and partially funded by MMSD and other grantors, the multi-year effort serves interested schools throughout the Milwaukee River basin. During a day-long workshop each September from 2004 through 2007, from 50 to more than 100 students and their teachers were provided with a bus tour by Commission/UW-Extension staff working cooperatively with the Washington County Land Conservation Department. The tour contained plan-related, developmental, environmental, and agricultural features in Washington and Ozaukee Counties, and included stops at two dairy farms of different sizes utilizing a variety of conservation practices designed to protect nearby waters. Two of the training years also included teacher workshops addressing the regional water quality management plan update for the greater Milwaukee watersheds.

### ***Farm Technology Days Exhibit***

In 2006, the Farm Technology Days exhibition provided a unique opportunity for the public involvement program to approach the agricultural community particularly in the northern part of the Greater Milwaukee Watersheds. The July 11-13 event represented the largest agricultural exhibition in the State. It was hosted in the Town of Lima, Sheboygan County, several miles east of the Milwaukee River watershed boundary, and occurred at a point in the study during which additional rural/agricultural involvement was being sought. An exhibit was thus placed in UW-Extension's tent pavilion, and staffed during the course of the event. This offered an opportunity for thousands of attendees to view plan-related display materials, and for staff to discuss relevant issues with hundreds of interested parties.

### ***Comprehensive Planning Meeting Updates***

As indicated in Appendix A-1, comprehensive plan-related updates were provided during regular planning meetings in Ozaukee, Racine, Washington, and Waukesha Counties. Objectives of providing water quality plan updates in Ozaukee, Racine, and Washington Counties included obtaining greater public involvement in areas outside the MMSD planning area and to offer the opportunity for those from the out-of-Region counties (Dodge, Fond du Lac, and Sheboygan) to learn about the plan. The Racine County meeting was expanded to include invitations to local officials, organizations, and interested citizens. Presentations regarding key comprehensive planning meetings are included in Appendix A-1.

### ***Updates for Additional Events and Organizations***

During the course of the study, the Commission staff provided numerous brief updates and input opportunities, beyond the items specifically referenced above in this appendix. The events and organization meetings involved were typically occurring for broader purposes; nevertheless, the inclusion of the water quality planning topic and the effect of this additional outreach were collectively important.

Examples include meeting updates for the Southeast Area Land & Water Conservation Association, and notably a summer 2007 bus tour in Milwaukee and Ozaukee Counties held in conjunction with the Soil and Water Conservation Society – Wisconsin Chapter. Updates were also given as part of presentations to additional professional association programs, college and university classes, UW-Milwaukee's Smart Growth Lecture Series, meetings of the Great Lakes Nonpoint Abatement Coalition, and the Public Policy Forum, among others. Meeting updates also pertained to environmental justice and the Commission's efforts to engage minority and low-income populations. Though the content of meetings with such group representatives more often was related to transportation and land use, the ongoing water quality planning was also noted as appropriate. The prospect of cleaner water and enhanced recreational activities in, and near, Milwaukee's central city, for instance, is a recognized asset by a number of organization leaders. The SEWRPC *Annual Report* in years corresponding to the

regional water quality management plan update briefly identified the range of events and organizations potentially reached by these additional means.

### **Other Informational and Educational Products**

A number of other informational and educational products were also utilized during the interagency planning process, some of which have been mentioned in general terms. Many of these were prepared under the Water Quality Initiative by MMSD and/or consultant staff, with contributions by, or information from, the Commission. All fit under the category of complementary use while avoiding duplicative efforts.

Nine issues of the WQI newsletter, *The Water Resource*, were published by MMSD during the study. These discussed the Commission's regional plan update as well as the District's 2020 facility plan, and included articles by Commission staff. That publication benefited the joint planning program, and, thus, general understanding of water quality issues by the public. In one case, an entire issue was dedicated to a SEWRPC-MMSD "Clean Rivers, Clean Lakes" conference.

Six watershed booklets were published by MMSD and made available at many of the public meetings described above. Separate booklets, using inventory information in part developed by the Commission, describe the resources, demographics, and water quality conditions existing within the Kinnickinnic River, Lake Michigan Direct Drainage Area, Menomonee River, Milwaukee River, Oak Creek, and Root River watersheds.

Periodic mass WQI e-mailings were distributed by MMSD. These included references to the joint planning which was taking place, notices of major events, and newly available publications, among other items.

A series of public informational documents was made available in coordination with the University of Wisconsin-Extension Service to inform and advise interested parties. For example, "Environmental Corridors – Lifelines of the Natural Resource Base," in the "Plan on It!" fact sheet series was revised and reprinted to help benefit the public involvement program. It was widely utilized in public informational meetings and posted with a direct link on the Commission's website. Also, the complementary "Yard Care and the Environment" fact sheets were made available through website link. That is a UW-Extension fact sheet series produced in part with assistance by the Commission to provide practical water quality advice through describing management alternatives for homeowners.

## Appendix A-1

### SEWRPC STAFF PRESENTATIONS ON THE REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE FOR THE GREATER MILWAUKEE WATERSHEDS

#### MMSD TECHNICAL ADVISORY TEAM MEETINGS<sup>a</sup>

| Meeting Date       | SEWRPC Staff Presentation                                                                                                                            |

February 20, 2004

Mr. Allen J. Buechel  
Fond du Lac County Executive  
Fond du Lac County Administration Center  
160 S. Macy street  
Fond du Lac, WI 54935

Dear Mr. Buechel:

The Southeastern Wisconsin Regional Planning Commission (SEWRPC) and the Milwaukee Metropolitan Sewerage District (MMSD) have embarked on a long-range planning process to examine how we can best meet the water quality needs for an important area, and we would very much appreciate your participation. The area involved includes all of the watersheds shown on the map attached hereto, namely, the Kinnickinnic River, Menomonee River, Milwaukee River, Root River, and Oak Creek watersheds; the Milwaukee Harbor estuary; and the adjacent nearshore Lake Michigan areas. We are using the U.S. Environmental Protection Agency (USEPA)'s recommended *watershed approach* to update the Regional Water Quality Management Plan and to develop the MMSD's 2020 Facilities Plan.

As part of this collaborative planning process, SEWRPC and MMSD are convening two groups to provide input and feedback on the plans as they are being developed. One of the groups is the Watershed Officials Forum. This Forum will provide a way for officials representing the various levels, units, and agencies of government to meet periodically to be briefed on project progress and to provide feedback and input on the planning program, including goals, alternatives, and the recommended plans. The membership of the Forum will include the chief elected officials or their designees from every county, city, village and town within the watershed area. The invitees to the Forum meetings will include the entire membership and each member may also designate a staff person to attend. The Watershed Officials Forum meetings are expected to be held about quarterly, beginning in April or May of this year, through 2006.

*We are asking you to join the Watershed Officials Forum and help us to plan for improved water quality in our region.*

Collaboration using the *watershed approach* will produce separate plans, but coordinated efforts. One planning program is the SEWRPC Regional Water Quality Management Plan Update for the Greater Milwaukee Watersheds and the other is the MMSD 2020 Facilities Plan. The *watershed approach* uses nature's boundaries instead of jurisdictional limits, it recommends decisions based on science and engineering and requires strong partnerships and public involvement with people, interest groups, and agencies.

Please contact either Gary Korb at SEWRPC (262-547-6721, extension 234, gkorb@sewrpc.org) or Karen Sands at MMSD (414-225-2123, ksands@mmsd.com) if you would like to be part of the Forum or would like additional information. Prior to all Forum meetings we will send notices and agendas to the entire invited membership.

We are also asking that you contact us with any recommendations you may have for membership on the Citizens Advisory Council, or CAC. The CAC is the second group where we are engaging citizen, business, environmental, and community representatives with interests related to water quality planning to join us in this planning effort. This group has been meeting since June 2003, but we are expanding it and asking for additional members, particularly in the outer watershed areas. If you wish, please provide nominations to one of the above contacts, if possible by March 5, 2004.

Thank you for your interest in improving water quality in our area, the Greater Milwaukee Watersheds.

Sincerely,

Kevin L. Shafer, P.E.  
Executive Director  
Milwaukee Metropolitan Sewerage District

# Watershed Officials Forum

## Region-Wide Upcoming Meeting

*On June 8 and 14, the Watershed Officials Forum will consider draft watershed issues identified by the Citizens Advisory Council for the Greater Milwaukee Watersheds.*

Please join us for this opportunity to discuss the future of water quality in the Greater Milwaukee Watersheds. The meetings will be held over two days to accommodate schedules; please attend just one meeting.

**The meeting dates are:**

**June 8, 2004**

**Riveredge Nature Center, Newburg  
5:30 - 7:15 p.m.**

**June 14, 2004**

**City of Greenfield Common  
Council Chambers  
12:30 - 2:15 p.m.**

*Please RSVP meeting choice by May 25 to*

**Gary Korb** 262-547-6721 or  
gkorb@sewrpc.org  
or  
**Karen Sands** 414-225-2123 or  
ksands@mmsd.com

*Note: Light refreshments  
will be served.*

# Water Quality INITIATIVE

May 28, 2004

## TO: Watershed Officials Forum (WOF) Members

Thank you for your ongoing commitment to helping the Milwaukee Metropolitan Sewerage District (MMSD) and Southeastern Wisconsin Regional Planning Commission (SEWRPC) shape water resource plans for the Greater Milwaukee Watersheds.

This is a reminder that the first meeting for the WOF will be held on June 8 at Riveredge Nature Center in Newburg and June 14 at Greenfield City Hall in Greenfield. ***The intention is that you select one meeting, based on your availability and convenience.*** Meeting times and an agenda are provided on the enclosed reminder notice. There will be an opportunity following the meeting to discuss recent MMSD weather-related events, interest permitting. ***We will share SEWRPC's proposed preliminary objectives and MMSD's issues that will become goals and objectives for the respective studies of each agency, with the goal of seeking your advice and comment.***

Therefore, enclosed in this mailing are the following:

- SEWRPC summary of goals and objectives
- SEWRPC comment form
- MMSD summary of Citizens Advisory Council process and results
- MMSD comment form
- List of issues raised at the Citizens Advisory Council meeting that relates to both SEWRPC's and MMSD's summaries

These pieces can be used together to help evaluate the input received thus far, and the progress toward establishing goals and objectives that will affect important waters from southern Fond du Lac and Sheboygan Counties to Racine County for years to come. If you are unable to attend either meeting, your governmental unit is still welcome to comment using the enclosed forms which accompany the SEWRPC and MMSD summaries. The long list of Citizens Advisory Council ideas is provided merely for your reference.

It is still anticipated that watershed and regional goals and objectives will be refined throughout the upcoming months, culminating in public open house meetings in the fall.

Please feel free to contact Karen Sands at MMSD (414.225.2123) or Gary Korb at SEWRPC (262.547.6721) for additional information.

## Regional Water Quality Management Plan Update

### Overview

The Commission has embarked on a long-range planning process to examine how to best meet the water quality needs for an important area, working in concert with the Milwaukee Metropolitan Sewerage District (MMSD). The area involved includes all of the watersheds shown on [Map 1](#), namely, the Kinnickinnic River, Menomonee River, Milwaukee River, Root River, and Oak Creek watersheds; the Milwaukee Harbor estuary; and the adjacent nearshore areas draining to Lake Michigan.

The interagency effort is using the U.S. Environmental Protection Agency's recommended watershed approach to update the Regional Water Quality Management Plan and to develop the MMSD's 2020 Facilities Plan for the study area, called the Greater Milwaukee Watersheds. The watershed approach uses nature's boundaries instead of jurisdictional limits, it recommends decisions based on science and engineering, and requires strong partnerships and public involvement with people, interest groups, and agencies. Also helping to coordinate the effort is the Wisconsin Department of Natural Resources (WDNR).

This may be regarded as a once-in-a-generation opportunity to examine and plan comprehensively for water quality on a multi-watershed basis. When completed, the plan will recommend the control of both point and nonpoint pollution sources, and provide the basis for decisions on community, industrial, and private waste disposal systems—all with ties to smart growth and sustained quality of life.

## Regional Water Quality Management Plan Update

### The Current Effort

During the last quarter of 2003, the Commission initiated work on an update of the regional water quality management plan for the Greater Milwaukee Watersheds. [Map 2](#) illustrates the civil divisions within the study area, and the accompanying table outlines the areal extent of these communities, by respective county.

The effort is being coordinated with a parallel sewerage facilities planning program being carried out by the MMSD and has been designed to utilize the watershed approach consistent with evolving U.S. Environmental Protection Agency policies. Such an approach represents good public planning and administration, as well as being consistent with the requirements of Section 208 of the Federal Clean Water Act.

The approach to carrying out the regional water quality management plan update and the MMSD facilities planning program in a coordinated manner was developed cooperatively by the WDNR, MMSD, and SEWRPC, and has been conceptually formalized under a Memorandum of Understanding.

The regional water quality management plan update will result in the reevaluation and, as necessary, revision of the three major elements comprising the original plan—the land use element, the point source pollution abatement element, and the nonpoint source pollution abatement element. In addition, a groundwater element will be added based largely upon companion work programs.

## Regional Water Quality Management Plan Update

### Planning Background

In 1979, the Commission completed and adopted a regional water quality management plan. The plan was designed, in part, to meet the Congressional mandate that the waters of the United States be made "fishable and swimmable" to the extent practical. It is set forth in SEWRPC Planning Report No. 30, *A Regional Water Quality Management Plan for Southeastern Wisconsin: 2000*, Volume One, *Inventory Findings*, September 1978; Volume Two, *Alternative Plans*, February 1979; and Volume Three, *Recommended Plan*, June 1979.

The regional water quality management plan, as well as the update currently under preparation, provides recommendations for the control of water pollution from such point sources as sewage treatment plants, points of separate and combined sewer overflow, and industrial waste outfalls. It also recommends controlling such nonpoint sources as urban and rural stormwater runoff. In addition to clear and concise recommendations for the control of water pollution, the plan provides the basis for:

- Continued eligibility of local units of government for Federal and State loans and grants in partial support of sewerage system development and redevelopment;
- Issuance of waste discharge permits by the Wisconsin Department of Natural Resources (WDNR);
- Review and approval of public sanitary sewer extensions by the WDNR; and
- Review and approval of private sanitary sewer extensions and large onsite sewage disposal systems and holding tanks by the Wisconsin Department of Commerce.

Subsequently, the Commission completed a report documenting the updated content and implementation status of the regional water quality management plan as amended over approximately its first 15 years: [SEWRPC Memorandum Report No. 93, A Regional Water Quality Management Plan for Southeastern Wisconsin: An Update and Status Report, March 1995](#). This status report also documents the extent of progress which had been made toward meeting the water use objectives and supporting water quality standards set forth in the regional plan.

## Regional Water Quality Management Plan Update

### Schedule

In order to complete the regional plan updating in a time frame which is consistent with the Milwaukee Metropolitan Sewerage District commitments for the completion of a new facilities plan, the updating process is being accomplished primarily with existing data. This will allow the plan update to be largely completed in approximately 30 months, extending to the end of 2006. Selected elements may be completed earlier as required by the MMSD facilities planning schedule. Plan documentation, continuing public involvement, and ongoing support for the MMSD facilities planning will be carried out in early 2007.

## **Regional Water Quality Management Plan Update**

### **Advisory Committee Structure**

Advisory committees form a most fundamental type of public involvement, with strong prospects for the planning program contributions to be of a broad and representative nature. Three types of advisory bodies are guiding the regional water quality management plan update, one of a technical nature, one to provide intergovernmental coordination and policy advice and assistance, and one citizen based.

#### **Technical Advisory Committee (TAC)**

The technical advisory committee is an integral part of the organization of the study, created by action of the Regional Planning Commission. The composition of this committee includes broad technical representation, including technical staffs, academia, business, agriculture, community and environmental organization representation, among others. The committee is designed to represent the entire study area. Included in its purview is a review of the draft planning report preparation and related technical work at important milestones. The committee also will be asked to review and provide advice on all important technical matters and decisions. Follow these links for a listing of the [TAC membership](#), and to find [plan chapters](#) reviewed and approved by the Committee.

#### **Watershed Officials Forum**

In addition to the technical committee, a Watershed Officials Forum has been organized to provide a basis for periodic briefings and to obtain feedback and input from the units and agencies of government on a watershedwide basis. This forum is one of the shared advisory bodies utilized by both the Commission and MMSD.

#### **Citizens Advisory Council (CAC)**

Another shared advisory body, the Citizens Advisory Council, has been formed in cooperation with the MMSD 2020 facilities planning program to actively involve private citizens, businesses, special interest groups, and industry representatives in the development of the planning studies. The Council functions as a representative body of concerned and diverse citizens. [Materials pertaining to the CAC](#) and interrelationships with other project committees can be viewed at the MMSD website.

## Regional Water Quality Management Plan Update

### Public Involvement Approach

The Commission's public involvement goal is to ensure early and continuous public notification about regional water quality planning activities, provide meaningful information concerning such work, and obtain participation in and input to regional water quality planning efforts. In short, public involvement will be essential to the conduct of the regional water quality management plan update.

The public involvement activities are being focused through the use of advisory committees, cooperative actions with related ongoing public involvement efforts, and other public involvement and watershed education programming.

It should be noted that MMSD and the Commission have developed and initiated a joint public involvement program for a number of key purposes, including joint activity planning and public events, several shared committees, and deferring to one another as appropriate in the preparation of informational and educational materials that both programs can utilize. Examples of the latter are newsletters and "State of the Watershed" booklets and pictorial tour maps produced by MMSD under its [Water Quality Initiative](#).

**BROCHURES FOR CLEAN RIVERS/CLEAN LAKES  
WATERSHED PLANNING CONFERENCES**

Southeastern Wisconsin Regional Planning Commission  
P.O. Box 1607  
Waukesha, Wisconsin 53187-1607

CONFERENCE ANNOUNCEMENT

# CLEAN RIVERS, CLEAN LAKES

*A watershed planning conference targeting the Greater Milwaukee Watersheds - from the Northern Kettle Moraine, south to Union Grove, and from the Subcontinental Divide east to Milwaukee and Racine, plus all points between, downstream toward Lake Michigan.*

February 10, 2004

Four Points Sheraton, Milwaukee North Hotel

STH 57 and Brown Deer Road

Brown Deer, Wisconsin

Sponsored by the

Southeastern Wisconsin Regional Planning Commission

and the

Milwaukee Metropolitan Sewerage District

In part, under a grant from the

U.S. Environmental Protection Agency

And in cooperation with the

Great Lakes Nonpoint Abatement Coalition

National Park Service

University of Wisconsin-Extension

and the

Wisconsin Department of Natural Resources

# WATERSHED PLANNING CONFERENCE

## *Our Purpose*

This day-long event will examine our actions within the Greater Milwaukee Watersheds and how they impact local streams, Lake Michigan, groundwater, and ultimately our drinking water. Learn about:

- ♦ Resource conditions
- ♦ Present needs
- ♦ Potential risks
- ♦ What you can do to help plan for quality waters both today and for future generations

Much has already been accomplished for water resource protection in Southeastern Wisconsin, and local communities and individuals can be credited for positive efforts. **HOWEVER** ..... many of our waters remain far from fishable and swimmable, as threats continue to be identified, or even grow. Some drinking water has become not only a quality concern, but also a quantity concern, in an otherwise "water rich" region. And while some areas are alarmed by all the new residents and associated land use changes, Lake Michigan must brace for both the associated runoff and the latest invasive species. Governmental units, businesses, and certain landowners will face increasing regulations and the ire of citizens and water recreationists because of such factors. Just keeping up with all of the information can be challenging.

For these reasons, we've invited:

- ♦ elected and appointed officials,
- ♦ water resource teams and councils,
- ♦ public and consulting agency staff,
- ♦ environmental groups,
- ♦ development industry representatives,
- ♦ and interested citizens to this important water quality conference.

The focus for the day will be on wise planning and actions within the Milwaukee, Menomonee, Kinnickinnic, Root, and Oak Creek watersheds, as well as small adjoining areas of direct drainage to Lake Michigan - all part of the Great Lakes system. Our target area of some 1,100 square miles, from southern Fond du Lac and Sheboygan Counties to Racine County, is also the subject of a new interagency planning effort which will be outlined.

**Please Reserve  
February 10, 2004  
for this important  
watershed planning  
conference**

Registration will be from 8:00-8:30,  
with plenary sessions all day.

### **Registration Fee**

Your \$10 conference fee, due February 5th, includes morning coffee and rolls, breaks, and the luncheon. You may register by fax, e-mail, or regular mail with payment included. The latter is preferable for fast check-in at the registration table.

### **Additional Information**

Questions about the program or the conference can be addressed to:  
Gary Korb, UW-Extension Regional  
Planning Educator working with  
SEWRPC.  
(262) 547-6721 ext. 234

# WATERSHED PLANNING CONFERENCE

## Agenda

- 8:00 Registration**  
Coffee, rolls, and conversation
- 8:30 Welcome and Introduction**  
*Philip C. Evenson, Executive Director, Southeastern Wisconsin Regional Planning Commission (SEWRPC)*  
*Kevin L. Shafer, Executive Director, Milwaukee Metropolitan Sewerage District (MMSD)*
- 8:45 Early History Of Water Use and Abuse In the Region**  
*John A. Gurda, Milwaukee Area Historian*  
♦ Questions and Answers
- 9:15 Lake Michigan and the Rivers That Run To It**  
Lake Michigan Basin Challenges and Opportunities  
*Judy Beck, Lake Michigan Team Manager, U.S. Environmental Protection Agency*  
The State of Our Watersheds - Progress in Wisconsin and its Southeastern Counties  
*Todd L. Ambs, Administrator, Division of Water, Wisconsin Department of Natural Resources (WDNR)*  
♦ Questions and Answers
- Break**
- 10:30 Water Quality Planning, Regulations, and Expectations**  
A Once-in-a-Generation Opportunity - Regional Water Quality Management Plan Update  
*Robert P. Biebel, Chief Environmental Engineer, SEWRPC*  
Major Upcoming Investments and the Involvement of Communities and Citizens - MMSD 2020 Facilities Plan  
*Karen L. Sands, Watershed Planning Manager, and Timothy R. Bate, Engineering Planning Manager, MMSD*  
Water Resource Regulations, Today and In the Future - Complementary State Efforts  
*Charles G. Burney, Special Assistant, Bureau of Watershed Management, WDNR*  
♦ Questions and Answers

- 12:00 Luncheon Program: Local Governments and a Clean Environment**  
*David A. Ullrich, Director, Great Lakes Cities Initiative, Chicago*  
♦ Questions and Answers
- 1:15 Exploring Public Understanding and Acceptance**  
What the Public Knows / Feels about Water Quality Issues - And How Today's Conference Attendees Compare  
*Kevin L. Shafer, Executive Director, MMSD*  
Development Alternatives With an Eye Toward Watershed Friendly Design  
*Robert G. Brownell, CEO, Bielinski Homes*  
Upstream Successes - Local Benefits and Downstream Gains  
*Daniel W. Stoffel, Washington County Board Supervisor and Farmer, Town of Kewaskum*  
♦ Questions and Answers
- Break**
- 2:45 Difficult Remaining Issues - But Knowledge Brings Promise**  
The Continuing Problem of Public Beach Closures  
*Dr. Sandra McLellan, Assistant Scientist, UW-Milwaukee Great Lakes WATER Institute*  
Groundwater and Drinking Water Supplies - Facts and Concerns  
*Madeline B. Gotkowitz, Hydrogeologist/Assistant Professor, Wisconsin Geological and Natural History Survey*  
Everyone Taking Responsibility - Restoring Resource Quality and Hydrologic Integrity  
*Roger T. Bannerman, Non-point Source Monitoring Specialist, WDNR*  
♦ Questions and Answers
- 4:00 Parting Thoughts**  
*Philip C. Evenson and Kevin L. Shafer*
- 4:15 Adjournment and Social Hour**

Milwaukee Metropolitan Sewerage District  
 260 W. Seeboth Street  
 Milwaukee, WI 53204

## *Conference Announcement*

# *Clean* rivers. *Clean* Lakes II

*The 2nd Annual Watershed Planning  
 Conference targeting the Greater  
 Milwaukee Watersheds - from the  
 Northern Kettle Moraine, south to Union  
 Grove, and from the Subcontinental  
 Divide east to Milwaukee and Racine,  
 plus all points between, downstream  
 toward Lake Michigan*

 Keep Greater Milwaukee Beautiful  
 Metropolitan Builders Association  
 Metropolitan Milwaukee Association of Commerce  
 Milwaukee River Basin Partnership  
 River Revitalization Foundation  
 Root-Pike WIN  
 Wisconsin Chapter, American Planning Association

The Water Quality Initiative presents the second annual

# Watershed Planning conference

*The rains of May in southeastern Wisconsin invigorated our on-going regional examination of water quality in our rivers, lakes and streams.*

For the past two years, regional and local agencies, partnering with citizens and local community organizations, have been working on updating our plans for regional water quality and the facilities and policies needed to make those improvements. This second annual watershed planning conference will focus our attention on the concerns of water quality and what we as homeowners, businesses, appointed and elected municipal officials, and conservationists can do. This conference will include a look at what happens to water quality when it rains, the region's interconnected sewer systems, numerous local and regional policy issues, case studies from other areas, and discussions of what's being done (and can be done in the future) to manage rain water.

For these reasons, we've invited:

- elected and appointed officials,
- water resource teams and councils,
- public and consulting agency staff,
- environmental groups,
- development industry representatives,
- and interested citizens to this important water quality conference.

The focus for the day will be on wise planning and actions within the Milwaukee, Menomonee, Kinnickinnic, Root, and Oak Creek watersheds, as well as small adjoining areas of direct drainage to Lake Michigan - all part of the Great Lakes system. Our target area of some 1,100 square miles, from southern Fond du Lac and Sheboygan Counties to Racine County, is also the subject of on-going interagency planning efforts which will be outlined.

**Please Reserve February 23, 2005**  
**for this important watershed planning conference**  
**Registration will be from 8:00-8:30, with sessions all day.**

**Registration Fee:** Your \$20 conference fee, due February 15th, includes morning coffee and rolls, breaks, and the luncheon. You may register by fax, e-mail, or regular mail with payment included. Pre-payment by mail will allow for faster check-in at the registration table.

**Additional Information:** Questions about the program or the conference can be addressed to:  
 Karen Sands, Watershed Planning Manager, MMSD  
 (414) 225-2123 or [ksands@mmsd.com](mailto:ksands@mmsd.com)

# Watershed Planning conference

## 8:00 Registration, coffee, rolls and conversation

### 8:30 Welcome

Kevin Shafer, Executive Director, Milwaukee Metropolitan Sewerage District (MMSD)

### 8:45 Opening Remarks

Tom Barrett, Mayor, City of Milwaukee

Mayor Barrett will welcome conference participants and address the importance of water resource planning and regional cooperation.

Gary Becker, Mayor, City of Racine

Mayor Becker will address the benefits and responsibilities of being a Great Lakes City and the importance of protecting our greatest natural resource.

### 9:15 Evolution of Stormwater Management

Russ Rasmussen, Director - Bureau of Watershed Management, Wisconsin Department of Natural Resources (WDNR)

Mr. Rasmussen will address how the WDNR has come to recognize stormwater as a major source of pollution and the subsequent regulation and management of stormwater in southeast Wisconsin and statewide.

### 9:45 Planning Projects Underway

Moderator – Dr. Nancy Frank, University of Wisconsin – Milwaukee (UWM)

The presenters will provide updates on the major watershed planning studies being led by the Southeastern Wisconsin Regional Planning Commission (SEWRPC) and the MMSD

- Status of the MMSD 2020 Facilities Plan – Karen Sands, Watershed Planning Manager, MMSD and Timothy Bate, Engineering Planning Manager, MMSD
- Status of the Regional Water Quality Management Update – Robert Biebel, Chief Environmental Engineer, SEWRPC

## Break

### 10:30 Water, Water Everywhere – Let's Manage It!

#### SESSION A

##### • Infiltration and Inflow 101

Moderator – Dr. Nancy Frank – UWM

The presenters will provide the audience with an understanding of the basics of the infiltration and inflow issues.

##### • Intro to I/I

Timothy Bate, Engineering Planning Manager, MMSD

##### • DNR – Why We Care

Jack Saltes, Wastewater Engineer, WDNR

#### SESSION B

##### • Infiltration and Inflow – the Role of Local Governments

Moderator – Dr. Carol Diggelman, Milwaukee School of Engineering

The presenters will provide the audience with information from actual programs and studies completed regarding lateral replacement and infiltration/inflow issues.

##### • Local Government Case Study – Lateral Replacement Program in Brown Deer, WI

Larry Neitzel, Superintendent of Public Works, Brown Deer, WI

- Legal Considerations Relating to Private Property I/I Programs  
Attorney Michael Simpson, Reinhart Boerner Van Deuren s.c.
- Overview of New Commerce Department Storm Codes  
Jim Zickert, Plumbing Consultant, Wisconsin Department of Commerce

#### SESSION C

##### • What's Happening in the Community? – Part I

Moderator – Angie Ternes, Rivers and Trails Program, National Park Service (NPS)

Presenters will offer information about stormwater projects in the community which are underway or built.

##### • Walnut Way and Environmental Stewardship

Sharon Adams, Walnut Way Conservation Corp

##### • Miller Brewing Company Rain Garden and Bioretention Swale

Willie Gonwa, Triad Engineering

##### • Tonawanda School Rain Garden

Michele Trawicki, Instructional Resource Teacher, Tonawanda School, Elm Grove, WI

### 11:45 Lunch and Keynote Speaker

Paul Loeb – *The Impossible Will Take a Little While*: Acting for Change in a Time of Fear

### 1:15 Wet Weather Impacts to Lake Michigan

Moderator – Kevin Shafer, MMSD

The presenter will share information from a research study on the fate and transport of bacteria into Lake Michigan and new research on storm pollution at Bradford Beach.

##### • The Fate and Transport of Bacterial Contamination in our Rivers and Lake Michigan

Dr. Sandra McLellan, Assistant Scientist, UWM Great Lakes WATER Institute

### 2:15 Brief Descriptions of the Milwaukee River Basin Partnership (Steve Books, MRBP President) and Root/Pike WIN (Allison Werner, Executive Director)

River Basin Partnership Groups are working creatively to address the concerns of Lake Michigan and the rivers that flow into it.

## Break

### 2:45 Taming the Raindrops

#### SESSION A

##### • Wet Weather and the Bottom Line

Moderator – Tim Sheehy, President, Metropolitan Milwaukee Association of Commerce

Presenters will discuss the impacts to businesses when spending on stormwater – related projects.

##### • Positive Aspects of Green Roofs and Related Technologies

David Ciepluch, Office of Energy Options, We Energies

##### • The Benefits of Porous Pavement

Steve Nikolas, President, Zabest Commercial Group

##### • Stormwater Benefits of Conservation Subdivisions

John Siepmann, Sales Agent, Siepmann Realty

#### SESSION B

##### • What's Happening in the Community? – Part 2

Moderator – Angie Ternes, NPS

Presenters will offer information about stormwater projects in the community which are underway or built.

##### • Sustainable Development – Building for the Future: Lessons from Utilizing Green Principles in Multi-Family Housing

Rocky Marcoux, Commissioner, Department of City Development, Milwaukee

##### • Advancing Sustainable Development in Milwaukee's

##### Menomonee River Valley

Peter McAvoy, Director of Environmental Health, 16th Street Community Health Center

##### • The Importance of Ulao Creek

Mike Grisar, President, Ulao Creek Partnership

#### SESSION C

##### • Resources Available to Local Governments

Moderator – Gary Korb, Regional Planning Educator, SEWRPC/UW-Extension

Presenters will discuss various tools, techniques and resources that are available

##### • Outreach and Education Resources for Your Community

Andy Yench, River Basin Educator, UW-Extension

##### • Using Funding Resources to Create a Stormwater Management

##### System at the Allis Chalmers Brownfield Site in West Allis

Rob Montgomery, Principal, Montgomery and Associates

##### • A Cool Tool for LID

Kevin Shafer, Executive Director, MMSD

#### SESSION D

##### • Sedimentation and Erosion

Moderator – Chris Magnuder, Community Environmental Liason, MMSD

Presenters will discuss information on the issues surrounding sedimentation and erosion of our rivers.

##### • West Branch of Sugar River: Case Study of a Successful Partnership for River Restoration

Frank Fetter, Executive Director, Upper Sugar River Watershed Association

##### • Technical Report on Statewide Sedimentation Issues

Dale Robertson – US Geological Service, WI

### 4:00 Call to Action

Paul Loeb

### 4:15 Closing

Phil Evenson, Executive Director, SEWRPC

Conference presentations will be posted to the project Web site at [www.mmsd.com/wqi](http://www.mmsd.com/wqi) as they are available. Printouts of presentations will not be provided at the conference in order to preserve natural resources.

### Keynote Speaker Paul Loeb

Based on thirty years examining the psychology of social involvement, Paul Loeb will explore how ordinary citizens can make their voices heard and actions count in a time when we're told neither matter. He'll look at how people get involved in larger community issues and what stops them from getting involved; how they burn out in exhaustion or maintain their commitment for the long haul; how involvement can give a sense of connection and purpose rare in purely personal life. He'll focus this conversation on our role as stewards of our local water system.

# Clean Rivers, Clean Lakes III

*The 3rd Annual Watershed Planning Conference targeting the Greater Milwaukee Watersheds - from the Northern Kettle Moraine, south to Union Grove, and from the Subcontinental Divide east to Milwaukee and Racine, plus all points between, downstream toward Lake Michigan*

**March 2, 2006**

Italian Community Center  
631 E. Chicago Street  
Milwaukee, Wisconsin

**Sponsored by:**

Milwaukee Metropolitan Sewerage District  
Southeastern Wisconsin Regional Planning Commission

**Conference Planning Committee:**

Milwaukee Metropolitan Sewerage District (MMSD)  
National Park Service  
Southeastern Wisconsin Regional Planning Commission (SEWRPC)  
University of Wisconsin - Milwaukee (UWM)  
University of Wisconsin - Extension  
Wisconsin Department of Natural Resources (WDNR)

*Water Quality*  
  
**INITIATIVE**  
[www.mmsd.com/wqi](http://www.mmsd.com/wqi)

A vertical, close-up photograph of water, showing numerous bubbles of various sizes. The bubbles are in sharp focus, revealing their spherical structure and the way light refracts through them. The background is a soft, out-of-focus blue, suggesting a larger body of water. The overall composition is clean and minimalist, emphasizing the natural texture and movement of water.

# Great Milwaukee Waters

*MMSD & SEWRPC present the third annual*

# Watershed Planning conference

Examining water quality in the rivers, lakes and streams of  
Fond du Lac, Milwaukee, Ozaukee, Racine, Sheboygan,  
Washington & Waukesha Counties

For the past three years, MMSD and SEWRPC, partnering with WDNR, USEPA, local environmental organizations, and communities have worked on updating both the SEWRPC Regional Water Quality Management Plan for the Greater Milwaukee Watersheds and the MMSD 2020 Facilities Plan. This third conference will feature that planning process, including presentations on 1) existing water quality conditions and sources of pollution in the Kinnickinnic, Menomonee, Milwaukee, and Root River, and Oak Creek watersheds and 2) the preliminary alternative plans that have been developed by MMSD and SEWRPC with an early opportunity for you to comment. The conference will include a look at watershed modeling, what it is and how it is used; inventory findings of instream and riparian habitat; information about water quality and the origins of pollution in our waterways; the magnitude, challenges and shared solutions integral to abating pollution; the complexity of water quality-related issues; the costs of possible approaches to improve water quality; and, finally, the necessity of everyone working together to preserve the Greater Milwaukee Watersheds.

For these reasons, we've invited:

- Elected and appointed officials
- Water resource teams and councils
- Public and consulting agency staff
- Environmental groups
- Industry representatives
- Developers, and
- Citizens interested in improving and protecting our water resources

The focus of this year's conference will be on the planning and actions within the Greater Milwaukee Watersheds, as well as small adjoining areas of direct drainage to Lake Michigan – all part of the Great Lakes System.

**March 2, 2006**

**Registration from 7:30-8:15, with sessions all day.**

**Registration Fee:** Your \$25 conference fee, due February 20, includes conference materials, morning coffee and rolls, breaks, and the luncheon. February 21 - March 1 conference fee will be \$30. Day of the Conference fee will be \$35. Pre-payment by mail will allow for faster check-in at the registration table.

**For More Information About the Conference:**

# Watershed Planning conference

## 7:30 Registration

Coffee, rolls, and conversation

## 8:15 Welcome

Mayor Tom Barrett – City of Milwaukee (Invited)

### • Conference Overview

A Watershed Event in Joint Planning – From History to Public Comments on Alternatives

Gary Korb, Regional Planning Educator, UW-Extension/SEWRPC

### • Historical Perspective on Water Quality

Where We've Come From . . . Reflections on Problems and Solutions

John Gurda, Milwaukee Area Historian

### • The Big Picture

The Lake Michigan Basin and the Region's Important Niche

Judy Beck, Lake Michigan Team Manager, USEPA

### • State of the Greater Milwaukee Watersheds

Basis of Plan Development

Karen Sands, Watershed Planning Manager, MMSD

Existing Water Quality Data and Pollution Sources

Michael Hahn, Chief Environmental Engineer, SEWRPC

Water Quality Modeling and How It Is Being Used

Dr. Leslie Shoemaker, Vice President, Water Resources,

Tetra Tech, Inc.

## BREAK

## 11:00 Details on Watersheds: Status & Building Blocks of Alternative Plans

Concurrent Sessions - Participants Choose A, B, or C

### Session A – Water Resource Science As Applied to the Current Planning

Moderator: Chris Magruder, Community and Environmental Liaison, MMSD

- Instream Habitat, Biological Conditions and Fishery Potential  
Dr. Thomas Slawski, Principal Planner, SEWRPC
- Wisconsin Buffer Initiative for Rural Water Quality Treatment  
Dr. Peter Nowak, Soil & Water Management Specialist, UW-Madison & UW-Extension
- Latest Studies on Bacteria in Stormwater  
Dr. Sandra McLellan, Assistant Scientist, UWM Great Lakes WATER Institute (Invited)

### Session B – Technologies Being Considered in the Planning

Moderator: Shirley Krug, Project Manager, MMSD

- Village of Shorewood Wet Weather Flow Management Program  
Dr. Mustafa Emir, Water Group Leader, Bonestroo & Associates

- Applications of Stormwater BMPs in Southeastern Wisconsin  
David Kendzierski, President, Stormtech, Inc.
- Physical/Chemical Wastewater Treatment of Peak Wet Weather Flows: Pilot Study Results  
Richard Onderko, Senior Project Manager, MMSD

## Session C – Programs, Policies, & Regulations Affecting Watershed Planning

Moderator: Angie Ternes, Rivers and Trails Program, U.S. National Park Service

- Milwaukee River North Branch Wildlife and Farming Heritage Area  
Dale Katsma, Wildlife Biologist, Wisconsin Department of Natural Resources (WDNR)
- Status of Separate Sewer Overflow Regulations  
Duane Schuettepelz, Section Chief, Wastewater Permits & Pretreatment, WDNR
- Permitting and Stormwater Requirements for Municipalities (NR 151 & NR 216)  
James Ritchie, Stormwater Specialist, WDNR

## 12:10 Lunch & Keynote Speaker

Clean Water, Healthy Future

Jeffrey Browne, President, Public Policy Forum (Invited)

## 1:20 Details of the MMSD's 2020 Facilities Planning Process

Water Quality Improvement for the Greater Milwaukee Watersheds

Kevin Shafer, Executive Director, MMSD

## Alternatives to Improve Our Water Resources

- The Watershed Planning Perspective  
Charles Krohn, Regional Water Leader, WDNR
- Considering Our Options, Trade-Offs, Responsibilities, and Costs  
Dr. Nancy Frank, Chair, Department of Urban Planning, UWM
- Overview of Screening and Preliminary Alternatives  
William Krill, Senior Project Manager, HNTB Corporation

## BREAK

## 2:45 More Details on Alternative Plans, or Other Planning Considerations

Concurrent Sessions - Participants Choose D or E

### Session D – Alternative Plans Focusing on the MMSD Planning Area

Moderator: Timothy Bate, Engineering Planning Manager, MMSD

- Preliminary Alternatives from the MMSD 2020 Facilities Planning Project and SEWRPC's Regional Water Quality Management Plan Update  
William Krill, Senior Project Manager, HNTB Corporation  
Dr. Leslie Shoemaker, Vice President, Water Resources, TetraTech, Inc.  
David Bennett, Great Lakes Infrastructure Practice Lead, Brown & Caldwell

Continued on following page...

## Session E – Other Watershed - Based Planning Considerations

Moderator: David Fowler, Project Manager, MMSD

- Estuary and Nearshore Lake Michigan Fishery  
*Bradley Eggold, Supervisor, Southern Lake Michigan Fisheries Work Unit, WDNR*
- Accelerated Conservation Reserve Enhancement Program for Streamside Buffers  
*Andrew Holschbach, Director, Planning, Resources and Land Management Department, Ozaukee County*
- Milwaukee Harbor Remedial Action Plan Status  
*Marsha Burzynski, Water Resources Planner, WDNR*

### 4:00 A Leadership Perspective on What Lies Ahead

Panel Discussion on What Was Heard Today and Prospects for the Future

Moderator: Philip Evenson, Executive Director, SEWRPC

- The Headwaters Perspective  
*Daniel Schmidt, Administrator, Village of Kewaskum, SEWRPC Commissioner & Chair of the Regional Water Quality Management Plan Advisory Committee*
- The Greater Milwaukee Watersheds Perspective  
*Peter McAvoy, Director of Environmental Health, Sixteenth St. Community Health Center*
- The Municipal Perspective  
*Neil Palmer, President, Village of Elm Grove*
- The MMSD & Green Team Perspective  
*Preston Cole, MMSD Commissioner & City of Milwaukee Green Team Steering Committee Member*

### 4:45 Summary & Adjournment

### 4:45 - 6:30 MMSD & SEWRPC Joint Open House

An opportunity for you to discuss what you heard today with technical staff, ask questions and comment on the preliminary alternatives presented during the conference.

## conference “At a Glance”

### 8:15 Morning Plenary Sessions

Gain an historical perspective on water quality in the area, be updated about issues and changes in the Lake Michigan Basin, and hear new findings regarding the state of the Greater Milwaukee Watersheds.

### 11:00 Concurrent Sessions

Choose from among three sessions, all designed to examine different aspects of water quality status and the underpinnings for plan alternatives:

**A:** Water Resource Science...from rural streams to nearshore Lake Michigan, study applications for the fishery, farmland management, and human use.

**B:** Technologies Being Considered...results of urban demonstrations, neighborhood practices, and pilot projects integral to the planning.

**C:** Programs, Policies, and Regulations...major initiatives from voluntary to mandatory that affect future upstream heritage and present municipal operations.

### 1:20 Early Afternoon Plenary Session

Learn the framework for improvement in the Greater Milwaukee Watersheds, featuring the direction we are heading and preliminary plan alternatives for getting there. Perspectives, options, trade-offs, responsibilities, costs, and future scenarios will all be discussed.

### 2:45 Concurrent Sessions

Choose from two different sessions, both offering more detail:

**D:** Preliminary Plan Alternatives Focusing on the MMSD... hear information about the preliminary plans that include A - completing all committed MMSD projects, B - meeting regulations on overflows and nonpoint source pollution and C – meeting the publicly inspired goals, and all current in-stream water quality criteria, using the watershed approach.

**E:** Other Watershed-Based Planning... considerations that complement the joint agency planning, examining major efforts both upstream and downstream.

### 4:00 Closing Plenary Session

Hear viewpoints on the day's proceedings and prospects for the future from area leaders representing the public, and nonprofit sectors, as well as jurisdictions of various types in different portions of the Greater Milwaukee Watersheds.

### 4:45 Open House

Comment directly on the preliminary plans, discuss questions directly with staff, view displays, & do a bit of socializing until 6:30 p.m.

## 4TH ANNUAL WATERSHED PLANNING CONFERENCE

TUESDAY, APRIL 24TH, 2007

CLARION HOTEL & CONFERENCE CENTER  
5311 SOUTH HOWELL AVENUE  
MILWAUKEE, WISCONSIN

## CLEAN RIVERS, CLEAN LAKES IV

The 4th Annual Watershed Planning Conference targeting the Greater Milwaukee Watersheds – from the Northern Kettle Moraine, south to Union Grove, and from the Subcontinental Divide east to Lake Michigan, and points in between.

**April 24, 2007**

**Clarion Hotel and Conference Center**  
5311 South Howell Avenue • Milwaukee, WI

**Sponsored by:**

Milwaukee Metropolitan Sewerage District  
Southeastern Wisconsin Regional Planning Commission

**Conference Planning Committee**

Milwaukee Metropolitan Sewerage District  
Southeastern Wisconsin Regional Planning Commission  
University of Wisconsin – Extension  
Wisconsin Department of Natural Resources  
National Park Service

In 2002, the Milwaukee Metropolitan Sewerage District (MMSD), Wisconsin Department of Natural Resources (WDNR) and Southeastern Wisconsin Regional Planning Commission (SEWRPC) formed the Water Quality Initiative (WQI) partnership. This partnership was the basis for a joint planning effort that used scientific techniques and a watershed-based approach to holistically assess and chart improvements for water resources within the Greater Milwaukee Watersheds. Through an extensive public involvement program, local governments, environmental organizations, business and industry, and citizens joined the partnership.

MMSD and SEWRPC have completed four years of intensive study and planning, and are ready to present their respective findings and implementation plans necessary for water quality improvement. The conference will feature the recommended programs, policies and operational changes in the companion plans, roles and responsibilities for getting things done, projected regional and local costs, activities necessary to improve water quality in our region, good examples used here and elsewhere, strategies for improved water resources within the Greater Milwaukee Watersheds, and finally, the necessity of everyone working together in our region on shared, cost-effective solutions.

# FOURTH ANNUAL WATERSHED PLANNING CONFERENCE

## REGISTRATION FORM WATERSHED PLANNING CONFERENCE

**7:30 Registration** Coffee, rolls, and conversation

**8:15 Welcome**  
Mayor Tom Barrett, City of Milwaukee

### Conference Overview

**A Watershed Event- Finalizing the Plans and Moving to Implementation**  
Philip Evenson, Executive Director, SEWRPC

**How the Region Fits into the Big Picture**  
Todd Ambts, Water Division Administrator, WDNR

**The Unveiling- Water Quality Plans for Action**  
MMSD 2020 Facilities Plan  
Tim Bate, Engineering Planning Manager, MMSD  
  
SEWRPC Regional Water Quality Management Plan Update  
Michael Hahn, Chief Environmental Engineer, SEWRPC

### BREAK

**10:45 Assembling the Building Blocks of Implementation**  
Concurrent Sessions — Participants choose Session A, B, or C

### SESSION A

**Treatment Technologies, Handling Stormwater, and Nonpoint Source Reduction**  
Moderator: Michael Hahn, Chief Environmental Engineer, SEWRPC

- **Racine - A Developed Community taking a Proactive Approach to Stormwater Pollution Control**  
Chuck Boehm, Earth Tech, Inc.  
Jaren Hiller, Water Resources Engineer, Earth Tech, Inc.
- **Emerging Technologies in the Recommended Plans**  
Troy Deibert, Project Engineer, HNTB Corp.  
Kevin Kratt, Director, Water Resources Group, Tetra Tech, Inc.

### SESSION B

**Local, Small-Scale Water Quality Improvement Projects**  
Moderator: Dave Fowler, Project Manager, MMSD

- **Every Drop Left Behind: Common Sense Landscaping for the 21<sup>st</sup> Century**  
Dennis Lukaszewski, Urban Agriculture Program Coordinator, UW- Extension, Milwaukee County Office

- **Examples of Successful Lake and Stream Restoration in Southeastern Wisconsin**  
Dr. Thomas Slawski, Principal Planner, SEWRPC

### SESSION C

**Conservation for Sustained Agricultural Profitability and Clean Water**  
Moderator: Sharon Gayan, Basin Supervisor, WDNR

- **Discovery Farms Programs: The Effects of Agriculture on the Environment**  
Dennis Frame and Dr. Fred Madison, Co-Directors, UW-Discovery Farms
- **Upstream Successes- Local Benefits and Downstream Gains**  
Daniel Stoffel, Washington County Board Supervisor and Farmer, Town of Kewaskum

### 12:00 Lunch and Keynote Speaker

**Water Wise Gardening**  
Melinda Meyers, Nationally Known Gardening Expert

### 1:15 Afternoon Plenary Session

Moderator: Christopher Magruder, Community and Environmental Liaison, MMSD

- **Stormwater Impacts on Recreational Waters**  
Dr. Sandra McLellan, Assistant Scientist, Great Lakes WATER Institute — UW-Milwaukee
- **"A New Awakening" for Achieving Water Quality Improvements**  
Kevin Shafer, Executive Director, MMSD

### BREAK

**2:30 Plan Implementation Issues and Implications for the Region**  
Concurrent Sessions - Participants choose Session D, E, or F

### SESSION D

**Strategies for Improved Water Quality**  
Moderator: William Krill, Senior Project Manager, HNTB Corp.

- **Watershed Implementation Strategies: Emerging Policies and Programs in Use Across the Country**  
Panel Discussion:  
Paul Freedman, President, Limno-Tech, Inc.  
James Klang, Senior Project Engineer, Keiser & Assoc.  
Dr. Leslie Shoemaker, Vice President Water Resources, TetraTech, Inc.

### SESSION E

**Stormwater and Being a Better Neighbor**  
Moderator: Angie Ternes, Rivers and Trails Program, U.S. National Park Service

- **Linking Watersheds, Landscapes and Communities**  
Gail Epping Overholt, Milwaukee River Basin Educator, Wisconsin Basin Initiative, UW-Extension
- **Wet Basements- The Overlooked Source of Infiltration/Inflow**  
Michael Campbell, Senior Vice President and COO, Ruekert and Mielke, Inc.

### SESSION F

**Reducing Nutrients in Runoff — Some New Looks**  
Moderator: Andrew Holschbach, Director, Planning, Resources and Land Management Department, Ozaukee County

- **Dane County's Ordinance Banning Unnecessary Phosphorus in Lawn Fertilizer**  
Susan Jones, Watershed Management Coordinator, Dane County
- **Runoff Management Solutions for Agricultural Landscapes**  
Dennis Frame and Dr. Fred Madison, Co-Directors, UW-Discovery Farms

### 3:45 Regional Cooperation — Challenges and Opportunities

Moderator: Kevin Shafer, Executive Director, MMSD

#### Panel Discussion:

Ann Beier, Director, Office of Environmental Sustainability, City of Milwaukee  
Philip Evenson, Executive Director, SEWRPC  
Scott Hassett, Secretary, WDNR (invited)  
Christine Nuernberg, Mayor, City of Mequon

### 4:30 Closing Remarks and Adjournment

Water Quality  
INITIATIVE

**April 24th, 2007**  
**Registration from 7:30 a.m - 8:15 a.m.**

**Registration Fee:** Your \$30 conference fee includes conference materials, breakfast, mid-morning and afternoon refreshments, and the luncheon. Pre-payment by mail will allow for faster check-in at the registration table. Send complete registration form and check (payable to MMSD) to the address below.

## News Release

October 9, 2007  
Release No. 07-05

### FOR IMMEDIATE RELEASE

For more information,  
contact Michael G. Hahn,  
Chief Environmental Engineer,  
at (262) 547-6721  
e-mail: [mhahn@sewrpc.org](mailto:mhahn@sewrpc.org)

### SEWRPC HOLDS PUBLIC HEARINGS ON REGIONAL WATER QUALITY MANAGEMENT PLAN

Citizens are invited to public information meetings and hearings related to the protection and improvement of water quality in a major portion of southeastern Wisconsin. These sessions will provide opportunities to learn more about, and to comment on, the findings and recommendations documented in Southeastern Wisconsin Regional Planning Commission (SEWRPC) Planning Report No. 50, A Regional Water Quality Management Plan Update for the Greater Milwaukee Watersheds. The plan includes recommendations related to land use, surface water quality, and groundwater quality in the Kinnickinnic, Menomonee, Milwaukee, and Root River watersheds; the Oak Creek watershed; and the direct drainage area to Lake Michigan. These watersheds are roughly comprised of areas draining toward Lake Michigan from extreme northeastern Dodge County, southeastern Fond du Lac County, southwestern Sheboygan County, eastern Washington County, all of Ozaukee County except the northeastern portion, extreme eastern Waukesha County, all of Milwaukee County, eastern Racine County, and a small portion of the Town of Paris in Kenosha County. The study area also includes the nearshore Lake Michigan area from the Village of Fox Point to the Village of Wind Point. Copies of the report chapters, including the recommended plan chapter, are now available for review on the SEWRPC web site at <http://www.sewrpc.org/waterqualityplan/chapters.asp>.

The plan was prepared by SEWRPC, in partnership with the Milwaukee Metropolitan Sewerage District (MMSD) under the "Water Quality Initiative," and in cooperation the Wisconsin Department of Natural

-more-

Resources (WDNR) and the U.S. Geological Survey (USGS). The plan was developed in close coordination with the MMSD 2020 Facilities Plan. Preparation of the plan was guided by a Technical Advisory Committee composed of representatives of county and municipal government, special-purpose units of government, MMSD, WDNR, USGS, the U.S. Environmental Protection Agency, academic institutions, and environmental and conservation organizations. In addition, the regional water quality management plan and MMSD Facilities Plan were presented and discussed at periodic meetings of a joint Citizens Advisory Council formed specifically to provide input on the two plans and at meetings of watershed officials, consisting of the elected and appointed representatives from the counties, cities, villages, and towns in the study area.

The following 4:30-7:00 p.m. sessions will be held during October 2007:

- October 15 at Gateway Technical College, Racine Campus, Racine Building, 901 Pershing Drive, Parking Lot D, Great Lakes, Room (#110)
- October 16 at the Downtown Transit Center, Harbor Lights Room (upper floor), 909 E. Michigan Street, Milwaukee
- October 23 at Riveredge Nature Center, 4458 W. Hawthorne Drive, Newburg, WI, 53060, located a mile north of STH 33 on CTH Y, northeast of Newburg

Each session will begin with a meeting in “open house” format from 4:30-5:30 p.m., which will provide an opportunity to meet one-on-one or in small groups with the Commission staff to receive information, ask questions, and provide comment. A presentation will be made by the Commission staff at 5:30 p.m., followed by a public hearing providing a forum for public comment in “town hall” format from approximately 6:00 p.m. to 7:00 p.m.

In addition to providing comments at the public meetings and hearings, written comments may also be submitted. Written comments should be received no later than Wednesday, October 24, 2007.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint source subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>Alternatives B1 and B2 assume full implementation of measures aimed at addressing agricultural runoff as set forth in Wisconsin Administrative Code Chapter NR 151. Alternatives C1 and C2 only assume a level of control that would be expected based on current levels of cost-share funding for such measures. As a result, nonpoint source loads under Alternatives C1 and C2 may, in some cases, be higher than under Alternatives B1 and B2.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominantly urban setting.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint source subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>Alternatives B1 and B2 assume full implementation of measures aimed at addressing agricultural runoff as set forth in Wisconsin Administrative Code Chapter NR 151. Alternatives C1 and C2 only assume a level of control that would be expected based on current levels of cost-share funding for such measures. As a result, nonpoint source loads under Alternatives C1 and C2 may, in some cases, be higher than under Alternatives B1 and B2.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominantly urban setting.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint source subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>Alternatives B1 and B2 assume full implementation of measures aimed at addressing agricultural runoff as set forth in Wisconsin Administrative Code Chapter NR 151. Alternatives C1 and C2 only assume a level of control that would be expected based on current levels of cost-share funding for such measures. As a result, nonpoint source loads under Alternatives C1 and C2 may, in some cases, be higher than under Alternatives B1 and B2.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominantly urban setting.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint source subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>Alternatives B1 and B2 assume full implementation of measures aimed at addressing agricultural runoff as set forth in Wisconsin Administrative Code Chapter NR 151. Alternatives C1 and C2 only assume a level of control that would be expected based on current levels of cost-share funding for such measures. As a result, nonpoint source loads under Alternatives C1 and C2 may, in some cases, be higher than under Alternatives B1 and B2.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominantly urban setting.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint source subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>Alternatives B1 and B2 assume full implementation of measures aimed at addressing agricultural runoff as set forth in Wisconsin Administrative Code Chapter NR 151. Alternatives C1 and C2 only assume a level of control that would be expected based on current levels of cost-share funding for such measures. As a result, nonpoint source loads under Alternatives C1 and C2 may, in some cases, be higher than under Alternatives B1 and B2.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominantly urban setting.

|                             |                                    | 2020 Future (baseline) | <1                | 3    | 11,843 | 11,846   | 487                          | 54                   | 541      | 12,387 |
|                             |                                    | B1                     | <1                | 2    | 11,843 | 11,845   | 473                          | 36                   | 509      | 12,354 |
|                             |                                    | B2                     | <1                | <1   | 11,843 | 11,843   | 473                          | 36                   | 509      | 12,352 |
|                             |                                    | C1                     | <1                | 2    | 11,843 | 11,845   | 502                          | 38                   | 540      | 12,385 |
|                             |                                    | C2                     | <1                | 2    | 11,843 | 11,845   | 502                          | 38                   | 540      | 12,385 |

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint source subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>Alternatives B1 and B2 assume full implementation of measures aimed at addressing agricultural runoff as set forth in Wisconsin Administrative Code Chapter NR 151. Alternatives C1 and C2 only assume a level of control that would be expected based on current levels of cost-share funding for such measures. As a result, nonpoint source loads under Alternatives C1 and C2 may, in some cases, be higher than under Alternatives B1 and B2.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominantly urban setting.

# OBJECTIVES, PRINCIPLES, AND STANDARDS

### Appendix G-1

#### LAND USE DEVELOPMENT OBJECTIVES, PRINCIPLES, AND STANDARDS FOR THE REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE FOR THE GREATER MILWAUKEE WATERSHEDS

(Note: The land use development standards to support the land use objectives were developed for the southeastern Wisconsin regional land use and comprehensive watershed planning programs. It is expected that these standards will form a framework and point of departure for subsequent county and local land use and comprehensive planning. For land use planning purposes in the Dodge, Fond du Lac, and Sheboygan areas, reliance will be placed upon local plans wherever available.)

#### OBJECTIVE NO. 1

A balanced allocation of space to the various land use categories which meets the social, physical, and economic needs of the study area population.

#### 1. URBAN LAND USE

##### PRINCIPLE<sup>a</sup>

The planned supply of land set aside for any given use should approximate the known and anticipated demand for that use.

##### STANDARDS

- A. For each additional 100 dwelling units to be accommodated within the study area at each residential density, the following amounts of residential and related land should be allocated:

| Urban Residential Density Category <sup>b</sup>                           | Residential Area <sup>c</sup><br>(acres per 100 dwelling units) | Residential Area, Plus<br>Supporting Land Uses <sup>d</sup><br>(acres per 100 dwelling units) |
|---------------------------------------------------------------------------|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| High-Density (7.0 or more dwelling units per net acre) <sup>e</sup> ..... | Less than 15                                                    | Less than 20                                                                                  |
| Medium-Density (2.3 to 6.9 dwelling units per net acre) .....             | 15-44                                                           | 20-59                                                                                         |
| Low-Density (0.7 to 2.2 dwelling units per net acre) .....                | 45-144                                                          | 60-169                                                                                        |

- B. For each additional 1,000 persons to be accommodated within the study area, at least five acres of land should be set aside in major public parks of at least 250 acres in size, and at least nine acres should be set aside in other public parks.

- C. For each additional 1,000 persons to be accommodated within the study area, approximately 12 acres of governmental and institutional land should be allocated.<sup>f</sup>
- D. For each additional 100 industrial employees to be accommodated within the study area, approximately 12 acres of industrial land should be allocated.<sup>f,g</sup>
- E. For each additional 100 commercial employees to be accommodated in retail and service settings within the study area, approximately six acres of retail and service land should be allocated.<sup>f</sup>
- F. For each additional 100 commercial employees to be accommodated in office settings within the study area, approximately 2.5 acres of commercial office land should be allocated.<sup>f,h</sup>

## **2. SUBURBAN-DENSITY RESIDENTIAL DEVELOPMENT**

Suburban density residential development—defined as a development at a density between 0.2 and 0.6 dwelling unit per acre, equivalent to between 1.5 and 4.9 acres per dwelling unit—is neither truly urban nor rural in character. Development at this density generally precludes the provision of centralized sanitary sewer and water supply facilities and other urban amenities. Development at this density can place excessive demands on streets and highways and public safety services in otherwise rural areas and result in a loss of rural character.

### **STANDARD**

- A. New suburban density residential development should be limited to that which is already committed in approved subdivision plats and certified surveys.

## **3. RURAL-DENSITY RESIDENTIAL DEVELOPMENT**

### **PRINCIPLE**

The demand for residential dwellings in an open space setting can best be accommodated at a density of no more than one dwelling unit per five acres. Development at this density can help minimize the impacts of such development on the natural resource base, on the demand for public facilities and services, and on the overall character of the rural environment.

### **STANDARD**

- A. Rural-density residential development—defined as development at a density of no more than one dwelling unit per five acres—should be accommodated on a limited basis, in response to market demands for residential development in an open space setting, where consistent with other land use objectives, as determined in county and local plans.

## **OBJECTIVE NO. 2**

A geographic distribution of the various land uses which will result in the protection and wise use of the natural resources of the study area, including its soils; inland lakes and streams, including floodwater storage areas, groundwater, wetlands, woodlands, prairies, and wildlife habitats, natural floodwater storage areas, and natural areas and critical species habitat.

## **1. ENVIRONMENTAL CORRIDORS AND ISOLATED NATURAL RESOURCE AREAS<sup>i</sup>**

### **PRINCIPLE**

The preservation of environmental corridors and isolated natural resource in essentially natural, open use yields many benefits, including recharge and discharge of groundwater; maintenance of surface water and groundwater quality; attenuation of flood flows and flood stages; maintenance of base flows of streams and watercourses; reduction of soil erosion; abatement of air and noise pollution; provision of wildlife habitat; protection of plant and animal diversity; protection of rare and endangered species; maintenance of scenic beauty; and provision of opportunities for recreational, educational, and scientific pursuits. Conversely, since the environmental corridors and isolated natural resource areas are frequently poorly suited for urban development, their preservation can help avoid serious and costly development problems.<sup>j</sup>

## **STANDARDS**

- A. Primary environmental corridors should be preserved in essentially natural, open uses.
- B. Secondary environmental corridors and isolated natural resource areas should be preserved in essentially natural, open uses to the extent practicable, as determined in county and local plans.

Uses considered to be compatible with the preservation of environmental corridors and isolated natural resource areas are indicated in Table G-1.

## **2. OTHER ENVIRONMENTALLY SENSITIVE AREAS**

### **PRINCIPLE**

Care in locating urban and rural development in relation to other environmentally sensitive areas can help to maintain the overall environmental quality of the study area and to avoid developmental problems.

### **STANDARDS**

- A. Small wetlands, woodlands, and prairies not identified as part of an environmental corridor or isolated natural resource area should be preserved to the extent practicable, as determined in county and local plans.<sup>k</sup>
- B. All natural areas and critical species habitat sites as identified in the regional natural areas and critical species habitat protection and management plan should be preserved.<sup>l</sup>
- C. One hundred-year recurrence interval floodlands should not be allocated to any development which would cause or be subject to flood damage; and no unauthorized structure should be allowed to encroach upon and obstruct the flow of water in perennial stream channels and floodways.
- D. Urban and rural development should be directed away from areas which are covered by soils with severe limitations for the use concerned, to the extent practicable.
- E. Potentially contaminating land uses should not be located in areas where the potential for groundwater contamination is the highest.
- F. Land use development patterns and practices should be designed to preserve important groundwater recharge areas and should support maintaining the natural surface and groundwater hydrology to the extent practicable.<sup>m</sup>

## **3. RESTORATION/ENHANCEMENT OF NATURAL CONDITIONS**

### **PRINCIPLE**

The restoration of farmland and other open space land to more natural conditions, resulting in the reestablishment or enhancement of wetlands, woodlands, prairies, grasslands, and forest interiors, can increase biodiversity and contribute to the overall environmental quality of the study area by providing additional functional values as set forth in No. 1 above.

### **STANDARD**

- A. Carefully planned efforts to restore farmland and other open space land to more natural conditions should be encouraged.

## **OBJECTIVE NO. 3**

A geographic distribution of the various land uses which is properly related to the supporting transportation, utility, and public facility systems, including stormwater management and sewerage, in order to provide these systems in as economical a manner as practical.

### **PRINCIPLE**

The transportation and public utility facilities and the land use pattern which these facilities serve and support are mutually interdependent in that the land use pattern determines the demand for, and loadings upon, transportation and utility facilities; and these facilities, in turn, are essential to, and form a basic framework for, land use development.

## STANDARDS

1. Urban development should be located and designed so as to maximize the use of existing transportation and utility systems.
2. The transportation system should be located and designed to serve not only all land presently devoted to urban development but to land planned to be used for such urban development.
3. The transportation system should be located and designed to minimize the penetration of existing and planned residential neighborhood units by through traffic.
4. Transportation terminal facilities, such as off-street parking, off-street truck loading, and public transit stops, should be located in proximity to the principal land uses to which they are accessory.
5. Land developed or planned to be developed for urban high-, medium-, and low-density residential use should be located in areas serviceable by an existing or planned public sanitary sewerage system and preferably within the gravity drainage area tributary to such a system.
6. Land developed or planned to be developed for urban high-, medium-, and low-density residential use should be located in areas serviceable by an existing or planned public water supply system.
7. Land developed or planned to be developed for urban high- and medium- density residential use should be located in areas serviceable by existing or planned public transit facilities.
8. Mixed use development should be encouraged to accommodate multi-purpose trips, including pedestrian trips, as a matter of convenience and efficiency.
9. In the absence of public sanitary sewer service, onsite sewage disposal systems should be utilized only in accordance with the following:
  - A. Onsite soil absorption sewage disposal systems should be sited and designed in accordance with Chapter Comm 83 of the *Wisconsin Administrative Code*.
  - B. The use of onsite sewage disposal systems should be limited to the following types of development:
    - Rural density residential development.
    - Suburban density residential development, limited, however, to areas already committed to such use through subdivision plats or certified surveys.
    - Urban land uses which may be required in unsewered areas such as transportation-related businesses, agriculture-related businesses, communication facilities, utility installations, and park and recreation sites.
  - C. New urban development served by onsite sewage disposal systems in areas planned to receive sanitary sewer service should be discouraged. Where such development is permitted, it should be designed so that the public and private costs of conversion to public sanitary sewer service are minimized.

## OBJECTIVE NO. 4

The preservation of land areas to provide for agriculture, provide a reserve or holding area for future urban and rural needs, and ensure the preservation of those rural areas which provide wildlife habitat and which are essential to shape and order urban development.

## PRINCIPLE

The preservation of productive agricultural land is important for meeting future needs for food and fiber. Agricultural areas, in addition to providing food and fiber, can provide wildlife habitat and contribute to the maintenance of an ecological balance between plants and animals. Moreover, the preservation of agricultural areas also contributes immeasurably to the maintenance of the scenic beauty and cultural heritage of the study area. Maintaining agricultural lands near urban areas can facilitate desirable and efficient production-distribution relationships, including community-supported agriculture operations. The preservation of agricultural lands can maximize return on investments in agricultural soil and water conservation practices;

minimize conflicts between farming operations and urban land uses; and help maintain an important component of the economic base of the study area.

## STANDARD

1. The most productive soils, those designated by the U.S. Natural Resources Conservation Service as comprising agricultural soil capability Classes I and II, should be preserved for agricultural use, to the extent practicable, recognizing that certain Class I and Class II farmland will have to be converted to urban use in order to accommodate the orderly expansion of urban service areas within the study area.

---

<sup>a</sup>*These standards are intended to be applied at the regional level of planning. It is recognized that these standards may be refined for application in county and community planning efforts.*

<sup>b</sup>*For purposes of this plan, residential densities are intended to be applied on an overall neighborhood, rather than a parcel-by-parcel, basis. The density categories represent overall densities that may be achieved within developing and redeveloping areas through various combinations of lot sizes and housing structure types over entire neighborhoods. The density ranges are broadly defined so as to provide flexibility to local units of government as they prepare local land use plans and administer local land use regulations within the framework provided by the regional plan. It is incumbent upon each community to determine at which point within the recommended density range that it wants development to occur.*

<sup>c</sup>*Residential area is defined as the actual site area devoted to residential use, and consists of the ground floor site area occupied by housing units and accessory structures plus the required yards and site area, but excludes streets. This definition does not preclude communities from considering open space land to be preserved in the calculation of housing unit yields for development projects.*

<sup>d</sup>*Supporting land uses include streets and utilities, neighborhood parks and playgrounds, elementary schools, and neighborhood institutional and commercial uses.*

<sup>e</sup>*For purposes of this plan, the high-density category includes residential development at densities of 7.0 dwelling units per acre or greater. Communities may choose to accommodate residential neighborhoods at densities substantially greater than the minimum threshold for the high-density range, particularly in redevelopment situations. In order to provide flexibility in this respect, no maximum density—or upper bound—is specified for the high-density category.*

<sup>f</sup>*Commercial, industrial, and governmental and institutional area includes the area devoted to the given use, consisting of the ground floor site area occupied by any building, required yards and open space, and parking and loading areas.*

<sup>g</sup>*The industrial standard is intended to be representative of typical new single-story industrial development. It should be recognized that the number of industrial employees per acre can vary considerably from site-to-site, depending upon the nature of the manufacturing activity, the level of automation, the extent to which warehousing or office functions are located at the site, and other factors.*

<sup>h</sup>*The office standard is equivalent to a floor area ratio of 30 percent and a gross building area of about 325 square feet per employee. In situations where high-rise office buildings are common, such as in the Milwaukee central business district, the ratio of land area allocated for office use to the related office employment would be significantly lower—or, stated another way, the number of office employees per acre would be significantly higher.*

<sup>i</sup>*Environmental corridors are elongated areas in the landscape which contain concentrations of natural resource features (lakes, rivers, streams, and their associated shorelands and floodlands; wetlands; woodlands; prairies; wildlife habitat areas; wet, poorly drained, and organic soils; and rugged terrain and high-relief topography) and natural resource-related features (existing park and open space sites; potential park and open space sites; historic sites; scenic areas and vistas; and natural areas and critical species habitat sites). Primary environmental corridors include a variety of these features and are at least 400 acres in size, two miles long, and 200 feet in width. Secondary environmental corridors also contain a variety of these features and are at least 100 acres in size and one mile in length. Isolated natural resource areas are smaller concentrations of natural resource features that are physically separated from the environmental corridors by intensive urban or agricultural uses; by definition, such areas are at least five acres in size.*

<sup>j</sup>*As used herein, the term “preserve” generally means to retain existing conditions. In some cases—for example, when used in relation to environmental corridors or isolated natural resource areas—this term has been specifically defined to indicate certain types of uses that are able to be accommodated while maintaining the overall integrity of the existing resources. The objectives and standards presented in this table indicate that certain areas should be preserved; they do not indicate the*

measures—such as public interest ownership, conservation easements, or land use regulation—that may be used to help assure the desired preservation. Such measures are dealt with in the plan and plan implementation chapters of this report.

<sup>k</sup>The following definitions are used throughout this report:

**Wetlands** are areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.

**Woodlands** are upland areas having 17 or more deciduous trees per acre each measuring at least four inches in diameter at breast height and having at least a 50 percent canopy cover. In addition, coniferous tree plantations and reforestation projects are defined as woodlands. Lowland wooded areas, such as tamarack swamps, are defined as wetlands because the water table in such areas is located at, near, or above the land surface and because such areas are generally characterized by hydric soils which support hydrophytic trees and shrubs.

**Prairies** are open, generally treeless areas which are dominated by native grasses. In southeastern Wisconsin, there are three types of prairies corresponding to soil moisture conditions: dry prairies, mesic prairies, and wet prairies. For purposes of this report, savannas, which are defined as areas dominated by native grasses but having between one and 17 trees per acre, are classified as prairies. In southeastern Wisconsin, there are two types of savannas: oak openings and cedar glades.

<sup>l</sup>Natural areas are tracts of land or water so little modified by human activity, or which have sufficiently recovered from the effects of such activity, that they contain intact native plant and animal communities believed to be representative of the pre-European-settlement landscape. Critical species habitat sites consist of areas, located outside natural areas, which support endangered, threatened, or rare plant or animal species. Most of the identified natural areas and critical species habitat sites are located within the environmental corridors and isolated natural resource areas of the study area.

<sup>m</sup>The regional water supply planning effort initiated in 2005 will identify important groundwater recharge areas and provide recommendations for their protection, as appropriate.

NOTE: An "X" indicates that facility development is permitted within the specified natural resource feature. In those portions of the environmental corridors having more than one of the listed natural resource features, the natural resource feature with the most restrictive development limitation should take precedence.

## APPLICABILITY

These guidelines indicate the types of development that can be accommodated within primary and secondary environmental corridors and isolated natural resource areas while maintaining the basic integrity of those areas. Throughout this table, the term "environmental corridors" refers to primary and secondary environmental corridors and isolated natural resource areas.

Under the plan:

- As regionally significant resource areas, primary environmental corridors should be preserved in essentially natural, open use—in accordance with the guidelines in this table.
- Secondary environmental corridors and isolated natural resource areas warrant consideration for preservation in essentially natural open use, as determined in county and local plans and in a manner consistent with State and Federal regulations. County and local units of government may choose to apply the guidelines in this table to secondary environmental corridors and isolated natural resource areas.

## GENERAL DEVELOPMENT GUIDELINES

- Transportation and Utility Facilities:** All transportation and utility facilities proposed to be located within the important natural resources should be evaluated on a case-by-case basis to consider alternative locations for such facilities. If it is determined that such facilities should be located within natural resources, development activities should be sensitive to, and minimize disturbance of, these resources, and, to the extent possible following construction, such resources should be restored to preconstruction conditions.

The above table presents development guidelines for major transportation and utility facilities. These guidelines may be extended to other similar facilities not specifically listed in the table.

- Recreational Facilities:** In general, no more than 20 percent of the total environmental corridor area should be developed for recreational facilities. Furthermore, no more than 20 percent of the environmental corridor area consisting of upland wildlife habitat and woodlands should be developed for recreational facilities. It is recognized, however, that in certain cases these percentages may be exceeded in efforts to accommodate needed public recreational and game and fish management facilities within appropriate natural settings.

The above table presents development guidelines for major recreational facilities. These guidelines may be extended to other similar facilities not specifically listed in the table.

- Rural Density Residential Development:** Rural density residential development may be accommodated in upland environmental corridors, provided that buildings are kept off steep slopes. The maximum number of housing units accommodated at a proposed development site within the environmental corridor should be limited to the number determined by dividing the total corridor acreage within the site, less the acreage covered by surface water and wetlands, by five. The permitted housing units may be in single-family or multi-family structures. When rural residential development is accommodated, conservation subdivision designs are strongly encouraged.
- Other Development:** In lieu of recreational or rural density residential development, up to 10 percent of the upland corridor area in a parcel may be disturbed in order to accommodate urban residential, commercial, or other urban development under the following conditions: 1) the area to be disturbed is compact rather than scattered in nature; 2) the disturbance area is located on the edge of a corridor or on marginal resources within a corridor; 3) the development does not threaten the integrity of the remaining corridor; and 4) the development does not result in significant adverse water quality impacts; 5) development of the remaining corridor lands is prohibited by a conservation easement or deed restriction. Each such proposal must be reviewed on a site-by-site basis.

Table G-1 (continued)

Under this arrangement, while the developed area would no longer be part of the environmental corridor, the entirety of the remaining corridor would be permanently preserved from disturbance. From a resource protection point of view, preserving a minimum of 90 percent of the environmental corridor in this manner may be preferable to accommodating scattered homesites and attendant access roads at an overall density of one dwelling unit per five acres throughout the upland corridor areas.

- **Pre-Existing Lots:** Single-family development on existing lots of record should be permitted as provided for under county or local zoning at the time of adoption of the land use plan.
- All permitted development presumes that sound land and water management practices are utilized.

<sup>a</sup>The natural resource and related features are defined as follows:

Lakes, Rivers, and Streams: Includes all lakes greater than five acres in area and all perennial and intermittent streams as shown on U. S. Geological Survey quadrangle maps.

Shoreland: Includes a band 50 feet in depth along both sides of intermittent streams; a band 75 feet in depth along both sides of perennial streams; a band 75 feet in depth around lakes; and a band 200 feet in depth along the Lake Michigan shoreline.

Floodplain: Includes areas, excluding stream channels and lakebeds, subject to inundation by the 100-year recurrence interval flood event.

Wetlands: Includes areas that are inundated or saturated by surface water or groundwater at a frequency, and with a duration sufficient to support, and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.

Wet Soils: Includes areas covered by wet, poorly drained, and organic soils.

Woodlands: Includes areas one acre or more in size having 17 or more deciduous trees per acre with at least a 50 percent canopy cover as well as coniferous tree plantations and reforestation projects; excludes lowland woodlands, such as tamarack swamps, which are classified as wetlands.

Wildlife Habitat: Includes areas devoted to natural open uses of a size and with a vegetative cover capable of supporting a balanced diversity of wildlife.

Steep Slope: Includes areas with land slopes of 12 percent or greater.

Prairies: Includes open, generally treeless areas which are dominated by native grasses; also includes savannas.

Park: Includes public and nonpublic park and open space sites.

Historic Site: Includes sites listed on the National Register of Historic Places. Most historic sites located within environmental corridors are archeological features such as American Indian settlements and effigy mounds and cultural features such as small, old cemeteries. On a limited basis, small historic buildings may also be encompassed within delineated corridors.

Scenic Viewpoint: Includes vantage points from which a diversity of natural features such as surface waters, wetlands, woodlands, and agricultural lands can be observed.

Natural Area and Critical Species Habitat Sites: Includes natural areas and critical species habitat sites as identified in the regional natural areas and critical species habitat protection and management plan.

<sup>b</sup>Includes such improvements as stream channel modifications and such facilities as dams.

<sup>c</sup>Includes trails for such activities as hiking, bicycling, cross-country skiing, nature study, and horseback riding, and excludes all motorized trail activities. It should be recognized that trails for motorized activities such as snowmobiling that are located outside the environmental corridors may of necessity have to cross environmental corridor lands. Proposals for such crossings should be evaluated on a case-by-case basis, and if it is determined that they are necessary, such trail crossings should be designed to ensure minimum disturbance of the natural resources.

<sup>d</sup>Includes areas intended to accommodate camping in tents, trailers, or recreational vehicles which remain at the site for short periods of time, typically ranging from an overnight stay to a two-week stay.

<sup>e</sup>Certain transportation facilities such as bridges may be constructed over such resources.

<sup>f</sup>Utility facilities such as sanitary sewers may be located in or under such resources.

<sup>g</sup>Electric power transmission lines and similar lines may be suspended over such resources.

<sup>h</sup>Certain flood control facilities such as dams and channel modifications may need to be provided in such resources to reduce or eliminate flood damage to existing development.

<sup>i</sup>Bridges for trail facilities may be constructed over such resources.

<sup>j</sup>Consistent with Chapter NR 115 of the Wisconsin Administrative Code.

<sup>k</sup>Streets and highways may cross such resources. Where this occurs, there should be no net loss of flood storage capacity or wetlands. Guidelines for mitigation of impacts on wetlands by Wisconsin Department of Transportation facility projects are set forth in Chapter Trans 400 of the Wisconsin Administrative Code.

<sup>l</sup>Consistent with Chapter NR 116 of the Wisconsin Administrative Code.

<sup>m</sup>Any development affecting wetlands must adhere to the water quality standards for wetlands established under Chapter NR 103 of the Wisconsin Administrative Code.

<sup>n</sup>Only an appropriately designed boardwalk/trail should be permitted.

<sup>o</sup>Wetlands may be incorporated as part of a golf course, provided there is no disturbance of the wetlands.

<sup>p</sup>Generally excludes detention, retention, and infiltration basins. Such facilities should be permitted only if no reasonable alternative is available.

<sup>q</sup>Only if no alternative is available.

<sup>r</sup>Only appropriately designed and located hiking and cross-country ski trails should be permitted.

<sup>s</sup>Only an appropriately designed, vegetated, and maintained ski hill should be permitted.

Source: SEWRPC.

## **Appendix G-2**

### **WATER QUALITY MANAGEMENT OBJECTIVES, PRINCIPLES, AND STANDARDS FOR THE REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE FOR THE GREATER MILWAUKEE WATERSHEDS**

#### **OBJECTIVE NO. 1**

The development of land management and water quality control facilities, programs, operational improvements, and policies, including land management and nonpoint pollution controls, sewerage and stormwater management systems—which will effectively serve the existing and planned future study area development pattern and meet wastewater disposal and stormwater runoff control needs.

#### **PRINCIPLE**

Sanitary sewerage and stormwater management systems are essential to the development and maintenance of a safe, healthy, and attractive urban environment. The extension of existing sanitary sewerage and stormwater management systems and the creation of new systems can be effectively used to guide and shape urban development both spatially and temporally.

#### **STANDARDS**

1. Sanitary sewer service should be provided to all existing areas of medium-<sup>a</sup> or high-density<sup>b</sup> urban development and to all areas proposed for such development in the appropriate adopted regional, county, and local land use plans.
2. Sanitary sewer service should be provided to all existing areas of low-density<sup>c</sup> urban development and to all areas proposed for such development in the appropriate adopted regional, county, and local land use plans where such areas are contiguous to areas of medium- or high-density urban development. Where noncontiguous low-density development already exists, the provision of sanitary sewer service should be contingent upon the inability of the underlying soil resource base to properly support onsite absorption waste disposal systems.
3. Engineered and partially engineered stormwater management facilities<sup>d</sup> should be provided to all existing areas of low-, medium, and high-density urban development and to all areas proposed for such development in the appropriate adopted regional, county, and local land use plans.
4. Where cognizant public health authorities declare that public health hazards exist because of the inability of the soil resource base to properly support onsite soil absorption waste disposal systems, sanitary sewer service should be provided.
5. Lands designated as primary environmental corridors, and certain secondary environmental corridors and isolated natural areas containing lands with steep slopes and/or wetlands, should not be served by sanitary sewers except in those cases where it is necessary to serve development incidental to the preservation and protection of the corridors and isolated natural areas, such as parks and related outdoor recreation areas, and existing clusters of urban development in such corridors and isolated natural areas. Engineering analyses relating to the sizing of sanitary sewerage and stormwater management facilities should assume the permanent preservation of all undeveloped primary environmental corridor lands, and certain portions of secondary corridors and isolated natural areas containing lands with steep slopes and wetlands, in natural open space uses.
6. Floodlands<sup>e</sup> should not be served by sanitary sewers except that development incidental to the preservation in open space uses of floodlands, such as parks and related outdoor recreation areas, and existing urban development in floodlands that is not recommended for eventual removal in comprehensive plans. Engineering analyses relating to the sizing of sanitary sewerage or stormwater management facilities should not assume ultimate development of floodlands for urban use.
7. The timing of the extension of sanitary sewerage facilities should, insofar as possible, seek to promote urban development in a series of complete neighborhood units. To achieve this, communities should encourage the provision of service to existing development and the development of new areas that have been included within the currently adopted sewer service area before adding new areas to a given municipal sewer service area.
8. The sizing of sanitary sewerage and stormwater management facility components should be based upon an assumption that future land use development will occur in general accordance with the appropriate adopted regional, county, and local land use plans.

9. To the extent feasible, industrial wastes except noncontact cooling waters, as well as the sanitary wastes generated at industrial plants, should be discharged to municipal sanitary sewerage systems for ultimate treatment and disposal. The necessity to provide pretreatment for industrial wastes should be determined on an individual case-by-case basis and should consider any regulations relating thereto.

10. Rural land management practices should be given priority in areas which are designated as prime agricultural lands to be preserved in long-term use for the production of food and fiber.

## **OBJECTIVE NO. 2**

The development of land management and water quality control facilities, programs, operational improvements, and policies, so as to meet the recommended water use objectives and supporting water quality standards, as set forth on Maps 51 through 56 and in Table 70 in Chapter VII of this report.

## **PRINCIPLE**

Rural and urban runoff, sewage treatment plant effluent, and industrial wastewater discharges are major contributors of pollutants to the streams and lakes of the study area; the location, design, construction, operation, and maintenance of stormwater management facilities, sewage treatment plants, and industrial wastewater outfalls, and the quality and quantity of the discharges from such facilities and of untreated runoff has a major effect on stream and lake water and sediment quality and on the ability of streams and lakes to support the established water uses. Urban stormwater runoff degrades surface water and sediment quality through the additions of conventional and potentially toxic pollutants. Urban stormwater runoff degrades surface water and sediment quality through the additions of conventional and potentially toxic pollutants. Urban stormwater runoff can degrade instream habitat quality by increasing channel scour, erosion, and sedimentation through increases in both the peak rate and the total volume of runoff.

## **STANDARDS**

1. The level of treatment to be provided at each sewage treatment plant and industrial wastewater outfall should be determined by water quality analyses directly related to the established water use objectives for the receiving surface waterbody. These analyses should demonstrate that the proposed treatment level will aid in achieving the water quality standards supporting each major water use objective, as set forth on Maps 51 through 56 and in Table 70 in Chapter VII of this report, as well as the related standards and criteria set forth in Chapter VI.

2. The type and extent of stormwater treatment or associated preventive land management practices to be applied within a hydrologic unit should be determined by water quality analyses directly related to the established water use objectives for the receiving surface waterbody. These analyses should demonstrate that the proposed treatment level or land management practices will aid in achieving the water quality standards and criteria supporting each major water use objective or classification, as set forth on Maps 51 through 56 and in Table 70 in Chapter VII of this report.

3. Domestic livestock should be fenced out, or otherwise excluded from, all lakes, perennial streams, and wetlands, and direct stormwater runoff from the associated feeding areas to the lakes, perennial streams, and wetlands should be avoided so as to contribute to the achievement of the established water use objectives and standards.

4. The discharge of sewage treatment plant effluent directly to inland lakes should be avoided and sewage treatment plant discharges to streams flowing into inland lakes should be located and treated so as to contribute to the achievement of the established water use objectives and standards for those lakes.

5. Interim sewage treatment plants deemed necessary to be constructed prior to implementation of the long-range plan should provide levels of treatment determined by water quality analyses directly related to the established water use objectives and standards for the receiving surface waterbody.

6. Bypassing of sanitary sewage to storm sewer systems, open channel drainage courses, and streams should be avoided.

7. Bypassing of combined sewage to the surface waters should be minimized to the extent needed to meet the established plan objectives.

8. Sewage treatment plants should be designed to perform their intended function and to provide their specified level of treatment under adverse conditions of inflow, should have sufficient standby capacity to allow maintenance to be performed without bypassing influent sewage, and should not be designed to bypass any flow delivered by the inflowing sewers, but may

incorporate an emergency bypass facility sufficient to protect sewage treatment equipment in cases of unforeseen equipment failure or the unforeseen occurrence of flows in excess of the design hydraulic capacity of the plant.

9. No pollutants should be discharged by sanitary or industrial sewage treatment plants in amounts which would preclude the achievement of the recommended water use objectives or the supporting standards.

10. The orderly transition of lands from open space, agricultural, or other rural uses to urban uses through excavation, landscaping, and construction should be planned, designed, and conducted so as to contribute to the achievement of the established water use objectives and standards.

### **OBJECTIVE NO. 3**

The development of land management and water quality control facilities, programs, operational improvements, and policies, which enhance the overall quality of the natural and man-made environments.

### **PRINCIPLE**

The improper design, installation, application, or maintenance of land management practices, sanitary sewerage system components, and stormwater management components can adversely affect the natural and man-made environments; therefore, every effort should be made in such actions to properly relate to these environments and minimize any disruption or harm thereto.

### **STANDARDS**

1. New and replacement sewage treatment plants, as well as additions to existing plants, should, wherever possible, be located on sites lying outside of the 1 percent probability floodplain. When it is necessary to use floodplain lands for sewage treatment plants, the facilities should be located outside of the floodway so as to not increase the 1 percent probability flood stage, and should be floodproofed to a flood protection elevation of two feet above the 1 percent probability flood stage so as to assure adequate protection against flood damage and avoid disruption of treatment and consequent bypassing of sewage during flood periods.

2. Existing sewage treatment plants located in the 1 percent probability floodplain should be floodproofed to a flood protection elevation of two feet above the 1 percent probability flood stage so as to assure adequate protection against flood damage and avoid disruption of treatment and consequent bypassing of sewage during flood periods.

3. The location of new and replacement of old sewage treatment plants or stormwater storage and treatment facilities should be properly related to the existing and proposed future urban development pattern as reflected in the appropriate adopted regional, county, and local land use plans and to any related community or neighborhood unit development plans.

4. New and replacement sewage treatment plants, as well as additions to existing plants, should be located on sites large enough to provide for adequate open space between the plant and existing or planned future urban land uses; should provide adequate area for expansion to ultimate capacity and should be located, oriented, and architecturally designed so as to complement their environs and to present an attractive appearance consistent with their status as public works.

5. The disposal of sludge from sewage treatment plants should be accomplished in the most efficient manner possible, consistent, however, with any adopted rules and regulations pertaining to air quality control and solid waste disposal.

6. Devices used for long-term or short-term storage of pollutants which are collected through treatment of wastewater or through the application of land management practices should, wherever possible, be located on sites lying outside of the 1 percent probability floodplain. When it is necessary to use floodplain lands for such facilities, such devices should be located outside of the floodway so as not to increase the 1 percent probability flood stage, and should be floodproofed to a flood protection elevation of two feet above the 1 percent probability flood stage so as to assure adequate protection against flood damage and to avoid redispersal of the pollutants into natural waters during flood periods.

7. There should be no known wastewater or stormwater discharges of heavy metals, chlorinated hydrocarbons, industrial chemicals, or other substances at levels known to be bioaccumulative, acutely or chronically toxic or hazardous to fish or other aquatic life, human health, wildlife, and domestic animals.

8. Water quality; sediment quality; and wildlife, fish, and aquatic life habitat should not be degraded beyond existing levels except where compelling economic hardship or social need is demonstrated and there are no technically and environmentally sound alternatives.

## OBJECTIVE NO. 4

The attainment of soil and water conservation and urban stormwater management practices which reduce stormwater runoff and control nonpoint source pollution in the form of soil erosion, nutrient enrichment, stream and lake sedimentation, other pollution, and resulting eutrophication.

### PRINCIPLE

Soil erosion and stream sedimentation, resulting from inadequate soil conservation and management practices for rural land and developing urban land, are significant problems within certain subwatersheds within the study area. Soil erosion reduces agricultural productivity through the loss of fertile topsoil and it also impairs or destroys aquatic habitat through the excessive deposition of sediment in wetlands and on streambeds.

### STANDARDS

1. The soil erosion rate on individual cropland fields should not exceed the T-value;<sup>f</sup> nor should sediment delivery to waterbodies exceed one ton per acre per year (as determined by the Natural Resources Conservation Service Revised Universal Soil Loss Equation).
2. Land disturbing activities associated with urban development and redevelopment and utility construction should include provisions to minimize the loss of sediment from the site so as to contribute to the achievement of the surface water use objectives.

---

<sup>a</sup>Medium-density development is defined as that development having an average dwelling unit density of 4.4 dwelling units per net residential acre, and a net lot area per dwelling unit ranging from 6,231 to 18,980 square feet.

<sup>b</sup>High-density development is defined as that development having an average dwelling unit density of 12.0 dwelling units per net residential acre, and a net lot area per dwelling unit ranging from 2,430 to 6,230 square feet.

<sup>c</sup>Low-density development is defined as that development having an average dwelling unit density of 1.2 dwelling units per net residential acre, and a net lot area per dwelling unit ranging from 18,981 to 62,680 square feet.

<sup>d</sup>Engineered stormwater management facilities are defined herein as the systems or subsystems of stormwater catchment, conveyance, storage, and treatment facilities comprised of structural and nonstructural controls including natural and man-made surface drains, subsurface piped drains, or combinations thereof, and of pumping stations, surface or subsurface storage or wet and dry detention basins, infiltration systems, and other appurtenances associated therewith, and sized to accommodate estimated flows or quantities from the tributary drainage area as a result of a specified meteorologic or hydrologic event.

<sup>e</sup>Floodlands are defined as those lands, including floodplains, floodways, and channels, subject to inundation by the flood event with a 1 percent probability flood or where such data are not available, the maximum flood of record.

<sup>f</sup>"T-value" is the tolerable soil loss rate—the maximum level of soil erosion that will permit a high level of crop productivity to be sustained economically and indefinitely, as determined by the U.S. Natural Resource Conservation Service. "Excessive" cropland erosion refers to erosion in excess of the tolerable rate, or T-value.

### **Appendix G-3**

#### **OUTDOOR RECREATION AND OPEN SPACE PRESERVATION OBJECTIVES, PRINCIPLES, AND STANDARDS FOR THE REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE FOR THE GREATER MILWAUKEE WATERSHEDS**

(Note: The outdoor recreation and open space preservation objectives, principles, and standards were developed for use in park and open space planning in the Southeastern Wisconsin Region. It is expected that these objectives, principles, and standards will form a framework and point of departure for subsequent county and local comprehensive plans. For planning purposes in Dodge, Fond du Lac, and Sheboygan Counties, reliance will be placed upon local plans wherever available.)

##### **OBJECTIVE NO. 1**

The provision of an integrated system of public general-use outdoor recreation sites and related open space areas which will allow the resident population of the watersheds involved adequate opportunity to participate in a wide range of outdoor recreation activities.

##### **PRINCIPLE**

Open space is the fundamental element required for the preservation and wise use of such natural resources as soil, water, woodlands, wetlands, native vegetation, and wildlife; it provides the opportunity to add to the physical, intellectual, and spiritual growth of the population; it enhances the economic and aesthetic value of certain types of development; and it is essential to outdoor recreational pursuits.

##### **STANDARDS**

1. Attainment of the standards pertaining to the preservation of environmentally significant lands under Land Use Development Objective No. 2 and the preservation of agricultural lands under Land Use Development Objective No. 4, would ensure the maintenance of an integrated system of open space lands within the study area. In addition, the following standards should be met:

- A. Major park and recreation sites providing opportunities for a variety of resource-oriented outdoor recreational activities should be provided within a 10-mile service radius of every dwelling unit in the study area, and should have a minimum gross site area of 250 acres.
- B. Other park and recreation sites should be provided within a maximum service radius of one mile of every dwelling unit in an urban area, and should have a minimum gross site area of five acres.
- C. Areas having unique scientific, cultural, scenic, or educational value should not be allocated to any urban or agricultural land uses; adjacent surrounding areas should be retained in open space use, such as agricultural or limited recreational uses.

##### **OBJECTIVE NO. 2**

The preservation of sufficient high-quality open-space lands for protection of the underlying and sustaining natural resource base to give form to and sustainability to urban development and to enhance the social and economic well-being and environmental quality of the watersheds involved.

##### **PRINCIPLE**

Ecological balance and natural beauty within the study area are primary determinants of the ability to provide a pleasant and habitable environment for all forms of life and to maintain the social and economic well being of the study area. Preservation of the most significant aspects of the natural resource base, that is, primary environmental corridors and prime agricultural lands, contributes to the maintenance of ecological balance, natural beauty, and economic well being of the study area.

##### **STANDARDS**

1. Attainment of the standards pertaining to the preservation of environmentally significant lands under Land Use Development Objective No. 2 and the preservation of agricultural lands under Land Use Development Objective No. 4, would ensure the preservation of sufficient, high-quality open space uses achieve this objective.

## **Appendix G-4**

### **WATER CONTROL FACILITY DEVELOPMENT OBJECTIVES, PRINCIPLES, AND STANDARDS FOR THE REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE FOR THE GREATER MILWAUKEE WATERSHEDS**

(Note: The water control facility development objective and standards set forth herein are largely related to floodland management planning. The focus of the regional water quality management plan update is water quality management, including stormwater management. However, because of the interrelationship of floodland management and stormwater management, as well as land use, the floodland management water control facility objective, principles, and standards are presented as background and supporting information.)

#### **OBJECTIVE NO. 1**

The development of an integrated system of stormwater management and flood control facilities, programs, operational improvements, and policies, which will efficiently and cost-effectively reduce flood damage and stormwater damage problems under the existing and future land use patterns and promote the implementation of the land use and comprehensive plans in the watersheds involved.

#### **PRINCIPLE**

Reliable local municipal stormwater management facilities cannot be properly planned, designed, or constructed except as integral parts of an areawide system of floodwater conveyance and storage facilities centered on major waterways and designed so that the hydraulic capacity of each waterway opening and channel reach abets the common aim of providing for the storage, as well as the movement, of floodwaters. Not only does the land use pattern of the tributary drainage area affect the required hydraulic capacity of the drainage and flood control facilities, but the effectiveness of the floodwater conveyance and storage facilities affects the uses to which land within the tributary watershed, and particularly within the riverine areas of the watershed, may properly be put.

#### **STANDARDS**

1. All new and replacement bridges and culverts over waterways shall be designed so as to accommodate, according to the categories listed below, the designated flood events without overtopping of the related roadway or railway track and resultant disruption of traffic by floodwaters.
  - A. Minor and collector streets used or intended to be used primarily for access to abutting properties: a 10 percent probability of occurrence flood discharge.
  - B. Arterial streets and highways, other than freeways and expressways, used or intended to be used primarily to carry heavy volumes of fast, through traffic: a 2 percent probability of occurrence flood discharge.
  - C. Freeways and expressways: a 1 percent probability of occurrence flood discharge.
  - D. Railways: a 1 percent probability of occurrence flood discharge.
2. All new and replacement bridges and culverts over waterways, including pedestrian and other minor bridges, in addition to meeting the applicable requirements of paragraph number 1 above, shall be designed so as to accommodate the 1 percent probability flood event with a 1 percent probability of occurrence, without raising the peak stage, either upstream or downstream, 0.01 foot or more above the peak stage for the 1 percent probability of occurrence flood. Larger permissible flood stage increases may be acceptable for reaches having topographic or land use conditions which could accommodate the increased stage without creating additional flood damage potential upstream or downstream of the proposed structure, and if appropriate legal arrangements are made with all affected local units of government and property owners.
3. The waterway opening of all new and replacement bridges shall be designed so as to readily facilitate the passage of ice floes and other floating debris, and thereby avoid blockages often associated with bridge failure and with unpredictable backwater effects and flood damages. In this respect, it should be recognized that clear spans and rectangular openings are more efficient than interrupted spans and curvilinear openings in allowing the passage of ice floes and other floating debris.
4. Certain new or replacement bridges and culverts over waterways, including pedestrian and other minor bridges, so located with respect to the stream system that the accumulation of floating ice or other debris may cause significant backwater effects with attendant danger to life, public health, or safety, or attendant serious damage to homes, industrial and commercial

buildings, and important public utilities, shall be designed so as to pass the 1 percent probability flood with at least 2.0 feet of freeboard between the peak stage and the low concrete or steel in the bridge span.

5. Standards 1, 3, and 4 shall also be used as the criteria for assessing the adequacy of the hydraulic capacity and structural safety of existing bridges or culverts over waterways and thereby serve as the basis for crossing modification or replacement recommendations designed to alleviate flooding and other problems.

6. All new and replacement bridges and culverts over waterways shall be designed so as not to inhibit fish passage in areas that are supporting, or which are capable of supporting, valuable recreational sport and forage fish species.

7. Channel modifications, dikes, and floodwalls should be restricted to the minimum number and extent necessary for the protection of existing and proposed land use development, consistent with the land use and water quality management elements of the regional water quality management plan update. The upstream and downstream effect of such structural works on flood discharges and stages shall be determined, and any such structural works which may significantly increase upstream or downstream peak flood discharges should be used only in conjunction with complementary facilities for the storage and/or conveyance of the incremental floodwaters through the watershed stream system. Channel modifications, dikes, or floodwalls shall not increase the height of the 1 percent probability flood 0.01 foot or more in any unprotected upstream or downstream stream reaches. Increases in flood stages that are equal to or greater than 0.01 foot resulting from any channel, dike, or floodwall construction shall be contained within the upstream or downstream extent of the channel, dike, or floodwall, except where topographic or land use conditions could accommodate the increased stage without creating additional flood damage potential and where appropriate legal arrangements are made with all affected local units of government and property owners.

8. In cases where a dike or floodwall is intended to protect human life, the minimum dike or floodwall top elevation shall be determined using whichever of the following produces the highest profile.

A. The 1 percent probability flood profile plan, plus three feet of freeboard, increasing to four feet at bridges, or

B. The 0.2 percent probability flood profile.

The height of low dikes or floodwalls that are not intended to protect human life shall be based on the high-water surface profiles for the 1 percent probability flood, and shall be capable of passing the 1 percent probability flood with a freeboard of at least 2.0 feet.

9. The construction of channel modifications, dikes, or floodwalls shall be deemed to change the limits and extent of the associated floodways and floodplains.<sup>a</sup> However, no such change in the extent of the associated floodways and floodplains shall become effective for the purposes of land use regulation until such time as the channel modifications, dikes, or floodwalls are actually constructed and operative. Any development in a former floodway or floodplain located to the landward side of any dike or floodwall shall be provided with adequate drainage so as to avoid ponding and associated damages.

10. Reduced regulatory flood protection elevations and accompanying reduced floodway or floodplain areas resulting from any proposed dams or diversion channels shall not become effective for the purposes of land use regulation until the reservoirs or channels are actually constructed and operative.

11. All water control facilities should be compatible with existing local stormwater management plans and as flexible as practical to accommodate future local stormwater management planning.

## **PRINCIPLE**

Floodlands that are unoccupied by, and not committed to, urban development should be retained in an essentially natural open space condition supplemented with the development of selected areas for public recreational uses or other open space uses. Maintaining floodlands in open uses will serve to protect downstream riverine communities from the adverse effects of the actions of upstream riverine communities by discouraging floodland development that would significantly aggravate existing flood problems or create new flood problems; will preserve natural floodwater conveyance and storage capacities; will avoid increased peak flood discharges and stages; will contribute to the preservation of wetland, woodland, fish and aquatic life, and wildlife habitat as part of a continuous linear system of open space will protect and enhance water and sediment quality; and will enhance the quality of life for both the urban and rural population by preserving and protecting the recreational, aesthetic, ecological, and cultural values of riverine and floodland areas.

## STANDARDS

1. All public land acquisitions, easements, floodland use regulations, and other measures intended to eliminate the need for water control facilities shall, in all areas not already in intensive urban use or committed to such use, encompass at least all of the riverine areas lying within the 1 percent probability flood inundation line under planned land use conditions.
2. Where hydraulic floodways are to be delineated, they shall to the maximum extent feasible accommodate existing and committed floodplain land uses.
3. In the determination of a hydraulic floodway, the hydraulic effect of potential floodplain encroachment shall be limited so that the peak stage of the 1 percent probability flood is not raised by 0.01 foot or more. Larger stage increases may be acceptable if appropriate legal arrangements are made with all affected local units of government and property owners.
4. The placement of fill within the limits of the 1 percent probability of occurrence floodplain shall be compensated for through the provision of an equal amount of floodwater storage volume within the floodplain. The compensatory storage volume shall be provided in close proximity to the area filled and the compensatory storage zone shall drain freely to the adjacent stream, enabling the volume to be available during successive floods. Where practical, the compensatory storage volume should be provided such that its elevation-volume relationship approximates the relationship existing for the area to be filled. That will ensure that the placement of fill will not result in increases in peak flood flows for floods which would occur more frequently than a 1 percent probability flood.
5. Floodlands should not be modified through alteration of existing stream channels for the sole purpose of accommodating planned urban land uses.

---

<sup>a</sup>Chapter NR 116 of the Wisconsin Administrative Code sets forth the conditions under which lands protected by dikes or floodwalls may be removed from the floodplain. Those conditions include: 1) the dike or floodwall meets the freeboard requirements given in Standard No. 8; 2) the dike or floodwall meets U.S. Army Corps of Engineers (USCOE) standards for design and construction; 3) interior drainage shall be provided in accordance with USCOE standards (see Standard No. 9); 4) an emergency action plan shall be in effect for the area protected by the dike or floodwall; 5) all persons receiving construction permits in the protected area shall be notified that their property would be located in the 1 percent probability of occurrence floodplain if the levee or dike were not in place; and 6) the levee or floodwall should be annually inspected by a professional engineer registered in the State of Wisconsin.

## **Appendix G-5**

### **PLAN STRUCTURE AND MONITORING OBJECTIVES, PRINCIPLES, AND STANDARDS FOR THE REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE FOR THE GREATER MILWAUKEE WATERSHEDS**

#### **OBJECTIVE NO. 1**

The development of land management and water quality control facilities, programs, operational improvements, and policies, that are both economical and efficient, meeting all other objectives at the lowest practical cost, considering both long-term capital and operation and maintenance costs.

#### **PRINCIPLE**

The total resources of the study area are limited and any undue investment in water pollution control systems must occur at the expense of other public and private investment; total pollution abatement costs, therefore, should be minimized while meeting and achieving all water quality standards and objectives.

#### **STANDARDS**

1. The sum of sanitary sewerage system operating and capital investment costs should be minimized.
2. The sum of stormwater control facility and related land management practice operating and capital investment costs should be minimized through proper stormwater management planning and design.
3. The total number of sanitary sewerage systems and sewage treatment facilities should be minimized in order to effect economies of scale and concentrate responsibility for water quality management. Where physical consolidation of sanitary sewer systems is uneconomical, administrative and operational consolidation should be considered in order to obtain economy in manpower utilization and to minimize duplication of administrative, laboratory, storage, and other necessary services, facilities, and equipment. The total number of diffuse pollution control facilities should be minimized in order to concentrate the responsibility for water quality management.
4. Maximum feasible use should be made of all existing and committed pollution control facilities, which should be supplemented with additional facilities only as necessary to serve the anticipated wastewater and stormwater management needs generated by substantial implementation of the appropriate adopted regional, county, and local land use plans, while meeting pertinent water quality use objectives and standards.
5. The use of new or improved materials and management practices should be allowed and encouraged if such materials and practices offer economies in materials or construction costs or by their superior performance lead to the achievement of water quality objectives at a lesser cost.
6. Sanitary sewerage systems, sewage treatment plants, and stormwater management facilities should be designed for staged or incremental construction where feasible and economical so as to limit total investment in such facilities and to permit maximum flexibility to accommodate changes in the rate of population growth and the rate of economic activity growth, changes in water use objectives and standards, or changes in the technology for wastewater management.
7. When technically feasible and otherwise acceptable, alignments for new sewer construction should coincide with existing public rights-of-way in order to minimize land acquisition or easement costs and disruption to the natural resource base.
8. Clearwater infiltration and inflows to the sanitary sewerage system should be reduced to the cost-effective level.
9. Sanitary sewerage systems and stormwater management systems should be designed and developed concurrently to effect engineering and construction economies as well as to assure the separate function and integrity of each of the two systems; to immediately achieve the pollution abatement and drainage benefits of the integrated design; and to minimize disruption of the natural resource base and existing urban development.

#### **OBJECTIVE NO. 2**

The development or use of land management and water quality management institutions—inclusive of the governmental units and their responsibilities, authorities, policies, procedures, and resources—and supporting revenue-raising mechanisms which are effective and locally acceptable, allowing the flexibility to provide a sound basis for plan implementation.

## **PRINCIPLE**

The activities necessary for the achievement of the established water use objectives and supporting standards are expensive; technically, administratively, and legally complex; and important to the economic and social well being of the residents of the study area. Such activities require a continuing, long-term commitment and attention from public and private entities. The conduct of such activities requires that the groups designated as responsible for plan implementation have sufficient financial and technical capabilities, legal authorities, and general public support to accomplish the specific tasks identified.

## **STANDARDS**

1. Each designated management agency should develop and establish a system of user charges and industrial cost recovery to maintain accounts to support the necessary operation, maintenance, and replacement expenditures.
2. Maximum utilization should be made of existing institutional structures in order to minimize the number of agencies designated to implement the recommended water quality control measures, and the creation of new institutions should be recommended only where necessary.
3. To the greatest extent possible, the responsibility for water pollution control and abatement should be assigned to the most immediate local public agency or to the most directly involved private entity.
4. Each designated management group should have legal authority, financial resources, technical capability, and practical autonomy sufficient to assure the timely accomplishment of its responsibilities in the achievement of the plan objectives.

## **OBJECTIVE NO. 3**

The development of land management and water quality control facilities, programs, operational improvements, and policies which are consistent with the expected study area economic development and attendant job creation.

## **PRINCIPLE**

The study area economy and its related employment is dependent upon the maintenance, growth, and development of business and industry which rely upon the provision of public facilities and infrastructure providing predictable opportunities that sustain and facilitate the economy

## **STANDARDS**

1. Recommend efficient water quality management plan components of an infrastructure system designed to serve the projected economy of the study area with flexibility to accommodate unanticipated economic development and job-creation opportunities.
2. Support the selection of plan components and facility construction which are accessible to local employers to the extent practicable.
3. Evaluate the potential economic development and workforce impacts of major water quality protection and improvement projects from the standpoints of both of costs or hardships borne and of opportunities stemming from quality of life improvements and relative competitiveness of the study area as a place to reside or site business.

## **OBJECTIVE NO. 4**

The development of land management and water quality facilities, programs, operational improvements, and policies which are flexible, adaptive, and robust in response to changing conditions.

## **PRINCIPLE**

As human understanding of the factors affecting water quality improves, the activities necessary for the achievement of the established water use objectives and supporting standards may require modification for responding to varying short- and long-term changes in conditions and emerging challenges. The conduct of such activities requires that the adopted plan and the designated management agencies have sufficient operational flexibility to respond to changing conditions.

## **STANDARDS**

1. The recommended plan components should be adaptable to change in scope, capacity, and effectiveness to the extent practical.
2. The recommended regional water quality management plan update should be periodically reviewed and each designated management agency should develop and establish mechanisms for reviewing the land management and water quality plan components and their associated responsibilities, both in support of the achievement of the recommended plan objectives and supporting standards and in the light of changing conditions.
3. The plan components should be designed for staged or incremental construction to the extent practical, so as to permit maximum flexibility to accommodate changes in expected future conditions.

## **OBJECTIVE NO. 5**

Improvement of the abilities to assess the state of water resources, to detect changes in these states, to evaluate the overall environmental and economic impacts of these changes, and to prescribe remedies for improving undesirable states.

## **PRINCIPLE**

Managerial practice should reflect changes in scientific understanding and technological capabilities which continue to improve human abilities to characterize the state of water resources and develop and implement remedies for undesirable states.

## **STANDARDS**

1. To the extent practicable, assessment of the state of water resources, the broader environmental context, and remedies prescribed for improving undesirable states should reflect the current level scientific understanding and practice.
2. As plan implementation and monitoring proceeds, the designated management agencies should be continually involved in evaluating and refining the plan components to reflect new state-of-the-art techniques directed toward efficiency and improved performance.
3. The designated management agencies should either collaboratively, or within their given mission, seek to identify and resolve discrete knowledge gaps relating to water quality and this plan, then share findings within the professional/scientific community.

## **OBJECTIVE NO. 6**

The development of mechanisms for fostering cooperation and collaboration among governmental units, organizations, the public, and other parties concerned with the quality of the land and water resources in the study area, in support of the other objectives.

## **PRINCIPLE**

The challenges posed in maintaining the quality of land and water resources and the activities necessary for the achievement of the established water use objectives and supporting standards often extend beyond the boundaries of any single political division and affect a variety of stakeholders, requiring the involvement and cooperation of multiple governmental units and agencies, private organizations, and members of the public.

## **STANDARDS**

1. Each designated management agency should develop and maintain linkages to other agencies and interested parties to encourage communication and coordination among institutions responsible for management, promote conservation of agency resources, and promote community involvement in the achievement of the recommended water use objectives and supporting standards.
2. Include integrated plan components, recognizing that citizens, as well as State, county, and local agencies; nongovernmental groups; agriculture; and other members of the business community to all serve a vital role in plan implementation.
3. As appropriate, and given staffing resources, designated management agencies should encourage and be supportive of water resource partnership groups, coalitions of governmental units or their officials, and professional associations designed to further dialogue and collectively act on behalf of water quality.

*Source: SEWRPC.*

## **Appendix G-6**

### **EDUCATIONAL AND INFORMATIONAL PROGRAMMING OBJECTIVES, PRINCIPLES, AND STANDARDS FOR THE REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE FOR THE GREATER MILWAUKEE WATERSHEDS**

#### **OBJECTIVE NO. 1**

The development of informational and educational mechanisms which will inform and educate the public and decision makers on water quality problems, needs, policies, and corrective actions, in support of the objectives above.

#### **PRINCIPLE**

Since certain behaviors by study area residents and businesses may be linked to water quality problems, successful achievement of the plan objectives and supporting standards will require the awareness, understanding, and involvement of informed decision makers and an informed public.

#### **STANDARDS**

1. The public should be provided with opportunities to use the water resources and to monitor the water quality conditions of the study area in ways that enhance understanding and appreciation of water quality.
2. Selected appropriate designated management agencies should develop and establish mechanisms to promote public awareness and involvement in the achievement of the recommended water use objectives and supporting standards.
3. The designated management agencies, working as appropriate with educational institutions, should regularly seek to measure the level of public awareness, understanding, and willingness to act for water quality protection, using such instruments as surveys, focus groups, or alternative means of assessment.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>Loads presented in this table for the 2020 future (baseline) condition reflect refinements that were made to the MMSD conveyance system model after the screening alternatives were evaluated. This results in certain anomalies in the load comparisons presented herein, particularly regarding SSO loads with Screening Alternative 2.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominantly urban setting.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>Loads presented in this table for the 2020 future (baseline) condition reflect refinements that were made to the MMSD conveyance system model after the screening alternatives were evaluated. This results in certain anomalies in the load comparisons presented herein, particularly regarding SSO loads with Screening Alternative 2.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominantly urban setting.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>Loads presented in this table for the 2020 future (baseline) condition reflect refinements that were made to the MMSD conveyance system model after the screening alternatives were evaluated. This results in certain anomalies in the load comparisons presented herein, particularly regarding SSO loads with Screening Alternative 2.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominantly urban setting.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominantly urban setting.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>Loads presented in this table for the 2020 future (baseline) condition reflect refinements that were made to the MMSD conveyance system model after the screening alternatives were evaluated. This results in certain anomalies in the load comparisons presented herein, particularly regarding SSO loads with Screening Alternative 2.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominantly urban setting.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>Loads presented in this table for the 2020 future (baseline) condition reflect refinements that were made to the MMSD conveyance system model after the screening alternatives were evaluated. This results in certain anomalies in the load comparisons presented herein, particularly regarding SSO loads with Screening Alternative 2.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominantly urban setting.

Indicates Revision from May 2013 Plan Amendment

<sup>a</sup>Alternatives B1 and B2 assume full implementation of measures aimed at addressing agricultural runoff as set forth in Wisconsin Administrative Code Chapter NR 151. Alternatives C1 and C2 only assume a level of control that would be expected based on current levels of cost-share funding for such measures. As a result, nonpoint source loads under Alternatives C1 and C2 may, in some cases, be higher than under Alternatives B1 and B2.

<sup>b</sup>Variance Standard in Chapter NR 104 of the Wisconsin Administrative Code.

 Indicates Revision from May 2013 Plan Amendment

<sup>a</sup>Alternatives B1 and B2 assume full implementation of measures aimed at addressing agricultural runoff as set forth in Wisconsin Administrative Code Chapter NR 151. Alternatives C1 and C2 only assume a level of control that would be expected based on current levels of cost-share funding for such measures. As a result, nonpoint source loads under Alternatives C1 and C2 may, in some cases, be higher than under Alternatives B1 and B2.

<sup>b</sup>Variance Standard in Chapter NR 104 of the Wisconsin Administrative Code.

<sup>a</sup>Alternatives B1 and B2 assume full implementation of measures aimed at addressing agricultural runoff as set forth in Wisconsin Administrative Code Chapter NR 151. Alternatives C1 and C2 only assume a level of control that would be expected based on current levels of cost-share funding for such measures. As a result, nonpoint source loads under Alternatives C1 and C2 may, in some cases, be higher than under Alternatives B1 and B2.
