 Indicates Revision from May 2013 Plan Amendment

<sup>a</sup>Alternatives B1 and B2 assume full implementation of measures aimed at addressing agricultural runoff as set forth in Wisconsin Administrative Code Chapter NR 151. Alternatives C1 and C2 only assume a level of control that would be expected based on current levels of cost-share funding for such measures. As a result, nonpoint source loads under Alternatives C1 and C2 may, in some cases, be higher than under Alternatives B1 and B2.

Indicates Revision from May 2013 Plan Amendment

<sup>a</sup>Alternatives B1 and B2 assume full implementation of measures aimed at addressing agricultural runoff as set forth in Wisconsin Administrative Code Chapter NR 151. Alternatives C1 and C2 only assume a level of control that would be expected based on current levels of cost-share funding for such measures. As a result, nonpoint source loads under Alternatives C1 and C2 may, in some cases, be higher than under Alternatives B1 and B2.

<sup>b</sup>Under Chapter NR 104 of the Wisconsin Administrative Code, this assessment point is in a stream reach classified as capable of supporting limited forage fish.

<sup>a</sup>Alternatives B1 and B2 assume full implementation of measures aimed at addressing agricultural runoff as set forth in Wisconsin Administrative Code Chapter NR 151. Alternatives C1 and C2 only assume a level of control that would be expected based on current levels of cost-share funding for such measures. As a result, nonpoint source loads under Alternatives C1 and C2 may, in some cases, be higher than under Alternatives B1 and B2.

NOTES: Capital and O&M costs obtained from HNTB Corporation.

10-year replacement costs and 20-year salvage values estimated by SEWRPC.

Capital costs reflect a 25 percent allowance for contingencies and a 35 percent allowance for engineering and administration costs, consistent with MMSD 2020 Facilities Plan.

Present worth and equivalent annual cost estimates based on 20-year economic life and 6 percent interest rate.

<sup>a</sup>This alternative is dependent on a determination that the MMSD South Shore plant has adequate existing peak wet-weather capacity to treat wastewater flows from the South Milwaukee sewerage system.

NOTES: Capital costs obtained from May 2006 City of South Milwaukee Wastewater Treatment Facility Site Study by Applied Technologies.

10-, 20- and 40-year replacement costs and 50-year salvage values estimated by SEWRPC.

Capital costs from Applied Technologies report have been adjusted to reflect a 25 percent allowance for contingencies and a 35 percent allowance for engineering and administration costs, consistent with MMSD 2020 Facilities Plan.

Applied Technologies report had used a 25 percent allowance for contingencies and a 15 percent allowance for engineering and administration.

Annual O&M cost from Andy Bacalarski (South Milwaukee) in personal communication with Jim Ibach (MMSD), per HNTB 11/30/06 cost estimate table for South Milwaukee.

Present worth and equivalent annual cost estimates based on 50-year economic life and 6 percent interest rate.

NOTES: Capital and O&M costs obtained from HNTB Corporation.

20- and 40-year replacement costs and 50-year salvage values estimated by SEWRPC.

Capital costs reflect a 25 percent allowance for contingencies and a 35 percent allowance for engineering and administration costs, consistent with MMSD 2020 Facilities Plan.

Present worth and equivalent annual cost estimates based on 50-year economic life and 6 percent interest rate.

<sup>a</sup>Includes force main operation and maintenance cost.

NOTES: Capital costs obtained from May 2006 City of South Milwaukee Wastewater Treatment Facility Site Study by Applied Technologies.

10- and 20-year replacement costs and salvage values estimated by SEWRPC.

Capital costs from Applied Technologies report have been adjusted to reflect a 25 percent allowance for contingencies and a 35 percent allowance for engineering & administration costs, consistent with MMSD 2020 Facilities Plan.

Applied Technologies report had used a 25 percent allowance for contingencies and a 15 percent allowance for engineering and administration.

Annual O&M cost from Andy Bacalarski (South Milwaukee) in personal communication with Jim Ibach (MMSD), per HNTB 11/30/06 cost estimate table for South Milwaukee.

Present worth and equivalent annual cost estimates based on 20-year economic life and 6 percent interest rate.

Source: Applied Technologies, HNTB, and SEWRPC.

NOTES: Capital and O&M costs obtained from HNTB Corporation.

20-year salvage values estimated by SEWRPC.

Capital costs reflect a 25 percent allowance for contingencies and a 35 percent allowance for engineering and administration costs, consistent with MMSD 2020 Facilities Plan.

Present worth and equivalent annual cost estimates based on 20-year economic life and 6 percent interest rate.

<sup>a</sup>Includes force main operation and maintenance cost.

## Table M-1 Footnotes

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>In certain limited cases, relatively minor anomalies in nonpoint source pollutant loads may occur among the five conditions for which model results are presented in this table. Those anomalies might indicate a relatively slight increase load under the recommended plan and/or "extreme measures" conditions, relative to revised 2020 baseline and/or revised 2020 baseline with five-year LOP conditions. In those cases, it may be assumed that no significant change in pollutant load occurs among those various conditions. Since it was not always possible to explicitly represent certain components of the recommended plan and "extreme measures" conditions in the LSPC water quality model, adjustments were made to model parameters that served as surrogates for the actual water pollution control measure being represented. In the sense that those modifications sometimes alter parameters established under the revised 2020 baseline and/or revised 2020 baseline with five-year LOP model versions, in limited cases, representation of a measure in the recommended plan or "extreme measures" models may have a side effect of introducing small, relatively small anomalies in the comparative results.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominately urban setting.

<sup>d</sup>Within the water quality models for the recommended plan and extreme measures condition, the detection and elimination of illicit discharges to storm sewer systems and control of urban sourced pathogens, including those in stormwater runoff, are represented using stormwater disinfection units. Such units were initially considered as a recommended approach to treatment of runoff, but were eliminated from further consideration based on comments from the Technical Advisory Committee. However, the use of such units is considered to be appropriate as a surrogate representation of the varied and as yet undetermined means that would be applied to detect and eliminate illicit discharges and to control pathogens in urban stormwater runoff. Those units explicitly address the control of bacteria in stormwater runoff, and, based on the way that bacteria loads are represented in the calibrated model, they also implicitly provide some control of bacteria that may reach streams through illicit connections that contribute to baseflow.

## Table M-2 Footnotes

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>In certain limited cases, relatively minor anomalies in nonpoint source pollutant loads may occur among the five conditions for which model results are presented in this table. Those anomalies might indicate a relatively slight increase load under the recommended plan and/or "extreme measures" conditions, relative to revised 2020 baseline and/or revised 2020 baseline with five-year LOP conditions. In those cases, it may be assumed that no significant change in pollutant load occurs among those various conditions. Since it was not always possible to explicitly represent certain components of the recommended plan and "extreme measures" conditions in the LSPC water quality model, adjustments were made to model parameters that served as surrogates for the actual water pollution control measure being represented. In the sense that those modifications sometimes alter parameters established under the revised 2020 baseline and/or revised 2020 baseline with five-year LOP model versions, in limited cases, representation of a measure in the recommended plan or "extreme measures" models may have a side effect of introducing small, relatively small anomalies in the comparative results.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominately urban setting.

<sup>d</sup>Within the water quality models for the recommended plan and extreme measures condition, the detection and elimination of illicit discharges to storm sewer systems and control of urban sourced pathogens, including those in stormwater runoff, are represented using stormwater disinfection units. Such units were initially considered as a recommended approach to treatment of runoff, but were eliminated from further consideration based on comments from the Technical Advisory Committee. However, the use of such units is considered to be appropriate as a surrogate representation of the varied and as yet undetermined means that would be applied to detect and eliminate illicit discharges and to control pathogens in urban stormwater runoff. Those units explicitly address the control of bacteria in stormwater runoff, and, based on the way that bacteria loads are represented in the calibrated model, they also implicitly provide some control of bacteria that may reach streams through illicit connections that contribute to baseflow.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>In certain limited cases, relatively minor anomalies in nonpoint source pollutant loads may occur among the five conditions for which model results are presented in this table. Those anomalies might indicate a relatively slight increase load under the recommended plan and/or "extreme measures" conditions, relative to revised 2020 baseline and/or revised 2020 baseline with five-year LOP conditions. In those cases, it may be assumed that no significant change in pollutant load occurs among those various conditions. Since it was not always possible to explicitly represent certain components of the recommended plan and "extreme measures" conditions in the LSPC water quality model, adjustments were made to model parameters that served as surrogates for the actual water pollution control measure being represented. In the sense that those modifications sometimes alter parameters established under the revised 2020 baseline and/or revised 2020 baseline with five-year LOP model versions, in limited cases, representation of a measure in the recommended plan or "extreme measures" models may have a side effect of introducing small, relatively small anomalies in the comparative results.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominately urban setting.

<sup>d</sup>Within the water quality models for the recommended plan and extreme measures condition, the detection and elimination of illicit discharges to storm sewer systems and control of urban sourced pathogens, including those in stormwater runoff, are represented using stormwater disinfection units. Such units were initially considered as a recommended approach to treatment of runoff, but were eliminated from further consideration based on comments from the Technical Advisory Committee. However, the use of such units is considered to be appropriate as a surrogate representation of the varied and as yet undetermined means that would be applied to detect and eliminate illicit discharges and to control pathogens in urban stormwater runoff. Those units explicitly address the control of bacteria in stormwater runoff, and, based on the way that bacteria loads are represented in the calibrated model, they also implicitly provide some control of bacteria that may reach streams through illicit connections that contribute to baseflow.

|                             |                 | Extreme Measures Condition <sup>d</sup>  | 0                        | <1   | <1       | 343                            | 43                 | 386      | 386   |

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>In certain limited cases, relatively minor anomalies in nonpoint source pollutant loads may occur among the five conditions for which model results are presented in this table. Those anomalies might indicate a relatively slight increase load under the recommended plan and/or "extreme measures" conditions, relative to revised 2020 baseline and/or revised 2020 baseline with five-year LOP conditions. In those cases, it may be assumed that no significant change in pollutant load occurs among those various conditions. Since it was not always possible to explicitly represent certain components of the recommended plan and "extreme measures" conditions in the LSPC water quality model, adjustments were made to model parameters that served as surrogates for the actual water pollution control measure being represented. In the sense that those modifications sometimes alter parameters established under the revised 2020 baseline and/or revised 2020 baseline with five-year LOP model versions, in limited cases, representation of a measure in the recommended plan or "extreme measures" models may have a side effect of introducing small, relatively small anomalies in the comparative results.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominately urban setting.

<sup>d</sup>Within the water quality models for the recommended plan and extreme measures condition, the detection and elimination of illicit discharges to storm sewer systems and control of urban sourced pathogens, including those in stormwater runoff, are represented using stormwater disinfection units. Such units were initially considered as a recommended approach to treatment of runoff, but were eliminated from further consideration based on comments from the Technical Advisory Committee. However, the use of such units is considered to be appropriate as a surrogate representation of the varied and as yet undetermined means that would be applied to detect and eliminate illicit discharges and to control pathogens in urban stormwater runoff. Those units explicitly address the control of bacteria in stormwater runoff, and, based on the way that bacteria loads are represented in the calibrated model, they also implicitly provide some control of bacteria that may reach streams through illicit connections that contribute to baseflow.

## Table M-5 Footnotes

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>In certain limited cases, relatively minor anomalies in nonpoint source pollutant loads may occur among the five conditions for which model results are presented in this table. Those anomalies might indicate a relatively slight increase load under the recommended plan and/or "extreme measures" conditions, relative to revised 2020 baseline and/or revised 2020 baseline with five-year LOP conditions. In those cases, it may be assumed that no significant change in pollutant load occurs among those various conditions. Since it was not always possible to explicitly represent certain components of the recommended plan and "extreme measures" conditions in the LSPC water quality model, adjustments were made to model parameters that served as surrogates for the actual water pollution control measure being represented. In the sense that those modifications sometimes alter parameters established under the revised 2020 baseline and/or revised 2020 baseline with five-year LOP model versions, in limited cases, representation of a measure in the recommended plan or "extreme measures" models may have a side effect of introducing small, relatively small anomalies in the comparative results.

<sup>c</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominately urban setting.

<sup>d</sup>Within the water quality models for the recommended plan and extreme measures condition, the detection and elimination of illicit discharges to storm sewer systems and control of urban sourced pathogens, including those in stormwater runoff, are represented using stormwater disinfection units. Such units were initially considered as a recommended approach to treatment of runoff, but were eliminated from further consideration based on comments from the Technical Advisory Committee. However, the use of such units is considered to be appropriate as a surrogate representation of the varied and as yet undetermined means that would be applied to detect and eliminate illicit discharges and to control pathogens in urban stormwater runoff. Those units explicitly address the control of bacteria in stormwater runoff, and, based on the way that bacteria loads are represented in the calibrated model, they also implicitly provide some control of bacteria that may reach streams through illicit connections that contribute to baseflow.

<sup>a</sup>Certain apparent anomalies in the relationship between urban and rural nonpoint source loads are due to the manner in which the loads were apportioned. In those cases, the loads in the nonpoint subtotal column generally exhibit the anticipated relationships between conditions.

<sup>b</sup>For reporting purposes, certain land uses such as forests and wetlands have been categorized as rural sources even though they may exist in a predominately urban setting.

<sup>c</sup>Within the water quality models for the recommended plan and extreme measures condition, the detection and elimination of illicit discharges to storm sewer systems and control of urban sourced pathogens, including those in stormwater runoff, are represented using stormwater disinfection units. Such units were initially considered as a recommended approach to treatment of runoff, but were eliminated from further consideration based on comments from the Technical Advisory Committee. However, the use of such units is considered to be appropriate as a surrogate representation of the varied and as yet undetermined means that would be applied to detect and eliminate illicit discharges and to control pathogens in urban stormwater runoff. Those units explicitly address the control of bacteria in stormwater runoff, and, based on the way that bacteria loads are represented in the calibrated model, they also implicitly provide some control of bacteria that may reach streams through illicit connections that contribute to baseflow.

 Indicates Revision from May 2013 Plan Amendment

## Table N-1 Footnotes

<sup>a</sup>In certain limited cases, relatively minor anomalies in concentrations or percents compliance may occur among the five conditions for which model results are presented in this table. Those anomalies might indicate a slight decrease in water quality under the recommended plan and/or "extreme measures" conditions, relative to revised 2020 baseline and/or revised 2020 baseline with five-year LOP conditions. In those cases, it may be assumed that no significant change in water quality occurs among those various conditions. Since it was not always possible to explicitly represent certain components of the recommended plan and "extreme measures" conditions in the LSPC water quality model, adjustments were made to model parameters that served as surrogates for the actual water pollution control measure being represented. In the sense that those modifications sometimes alter parameters in the revised 2020 baseline and/or revised 2020 baseline with five-year LOP model versions, in limited cases, representation of a measure in the recommended plan or "extreme measures" models may have a side effect of introducing small, relatively insignificant anomalies in the comparative results.

<sup>b</sup>Five-Year LOP refers to a five-year recurrence interval level of protection against sanitary sewer overflows.

<sup>c</sup>Within the water quality models for the recommended plan and extreme measures condition, the detection and elimination of illicit discharges to storm sewer systems and control of urban sourced pathogens, including those in stormwater runoff, are represented using stormwater disinfection units. Such units were initially considered as a recommended approach to treatment of runoff, but were eliminated from further consideration based on comments from the Technical Advisory Committee. However, the use of such units is considered to be appropriate as a surrogate representation of the varied and as yet undetermined means that would be applied to detect and eliminate illicit discharges and to control pathogens in urban stormwater runoff. Those units explicitly address the control of bacteria in stormwater runoff, and, based on the way that bacteria loads are represented in the calibrated model, they also implicitly provide some control of bacteria that may reach streams through illicit connections that contribute to baseflow.

<sup>d</sup>Variance Standard in Chapter NR 104 of the Wisconsin Administrative Code.

 Indicates Revision from May 2013 Plan Amendment

## Table N-2 Footnotes

<sup>a</sup>In certain limited cases, relatively minor anomalies in concentrations or percents compliance may occur among the five conditions for which model results are presented in this table. Those anomalies might indicate a slight decrease in water quality under the recommended plan and/or “extreme measures” conditions, relative to revised 2020 baseline and/or revised 2020 baseline with five-year LOP conditions. In those cases, it may be assumed that no significant change in water quality occurs among those various conditions. Since it was not always possible to explicitly represent certain components of the recommended plan and “extreme measures” conditions in the LSPC water quality model, adjustments were made to model parameters that served as surrogates for the actual water pollution control measure being represented. In the sense that those modifications sometimes alter parameters in the revised 2020 baseline and/or revised 2020 baseline with five-year LOP model versions, in limited cases, representation of a measure in the recommended plan or “extreme measures” models may have a side effect of introducing small, relatively insignificant anomalies in the comparative results.

<sup>b</sup>Five-Year LOP refers to a five-year recurrence interval level of protection against sanitary sewer overflows.

<sup>c</sup>Within the water quality models for the recommended plan and extreme measures condition, the detection and elimination of illicit discharges to storm sewer systems and control of urban sourced pathogens, including those in stormwater runoff, are represented using stormwater disinfection units. Such units were initially considered as a recommended approach to treatment of runoff, but were eliminated from further consideration based on comments from the Technical Advisory Committee. However, the use of such units is considered to be appropriate as a surrogate representation of the varied and as yet undetermined means that would be applied to detect and eliminate illicit discharges and to control pathogens in urban stormwater runoff. Those units explicitly address the control of bacteria in stormwater runoff, and, based on the way that bacteria loads are represented in the calibrated model, they also implicitly provide some control of bacteria that may reach streams through illicit connections that contribute to baseflow.

<sup>d</sup>Variance Standard in Chapter NR 104 of the Wisconsin Administrative Code.

## Table N-3 Footnotes

<sup>a</sup>In certain limited cases, relatively minor anomalies in concentrations or percents compliance may occur among the five conditions for which model results are presented in this table. Those anomalies might indicate a slight decrease in water quality under the recommended plan and/or "extreme measures" conditions, relative to revised 2020 baseline and/or revised 2020 baseline with five-year LOP conditions. In those cases, it may be assumed that no significant change in water quality occurs among those various conditions. Since it was not always possible to explicitly represent certain components of the recommended plan and "extreme measures" conditions in the LSPC water quality model, adjustments were made to model parameters that served as surrogates for the actual water pollution control measure being represented. In the sense that those modifications sometimes alter parameters in the revised 2020 baseline and/or revised 2020 baseline with five-year LOP model versions, in limited cases, representation of a measure in the recommended plan or "extreme measures" models may have a side effect of introducing small, relatively insignificant anomalies in the comparative results.

<sup>b</sup>Five-Year LOP refers to a five-year recurrence interval level of protection against sanitary sewer overflows.

<sup>c</sup>Within the water quality models for the recommended plan and extreme measures condition, the detection and elimination of illicit discharges to storm sewer systems and control of urban sourced pathogens, including those in stormwater runoff, are represented using stormwater disinfection units. Such units were initially considered as a recommended approach to treatment of runoff, but were eliminated from further consideration based on comments from the Technical Advisory Committee. However, the use of such units is considered to be appropriate as a surrogate representation of the varied and as yet undetermined means that would be applied to detect and eliminate illicit discharges and to control pathogens in urban stormwater runoff. Those units explicitly address the control of bacteria in stormwater runoff, and, based on the way that bacteria loads are represented in the calibrated model, they also implicitly provide some control of bacteria that may reach streams through illicit connections that contribute to baseflow.

<sup>d</sup>Under Chapter NR 102 of the Wisconsin Administrative Code and Wisconsin Trout Streams (1980), this assessment point is in a stream reach classified as capable of supporting a coldwater biological community.

<sup>e</sup>Under Chapter NR 104 of the Wisconsin Administrative Code, this assessment point is in a stream reach classified as capable of supporting limited forage fish.

<sup>f</sup>Variance Standard in Chapter NR 104 of the Wisconsin Administrative Code.

 Indicates Revision from May 2013 Plan Amendment

#### Table N-4 Footnotes

<sup>a</sup>In certain limited cases, relatively minor anomalies in concentrations or percents compliance may occur among the five conditions for which model results are presented in this table. Those anomalies might indicate a slight decrease in water quality under the recommended plan and/or "extreme measures" conditions, relative to revised 2020 baseline and/or revised 2020 baseline with five-year LOP conditions. In those cases, it may be assumed that no significant change in water quality occurs among those various conditions. Since it was not always possible to explicitly represent certain components of the recommended plan and "extreme measures" conditions in the LSPC water quality model, adjustments were made to model parameters that served as surrogates for the actual water pollution control measure being represented. In the sense that those modifications sometimes alter parameters in the revised 2020 baseline and/or revised 2020 baseline with five-year LOP model versions, in limited cases, representation of a measure in the recommended plan or "extreme measures" models may have a side effect of introducing small, relatively insignificant anomalies in the comparative results.

<sup>b</sup>Five-Year LOP refers to a five-year recurrence interval level of protection against sanitary sewer overflows.

<sup>c</sup>Within the water quality models for the recommended plan and extreme measures condition, the detection and elimination of illicit discharges to storm sewer systems and control of urban sourced pathogens, including those in stormwater runoff, are represented using stormwater disinfection units. Such units were initially considered as a recommended approach to treatment of runoff, but were eliminated from further consideration based on comments from the Technical Advisory Committee. However, the use of such units is considered to be appropriate as a surrogate representation of the varied and as yet undetermined means that would be applied to detect and eliminate illicit discharges and to control pathogens in urban stormwater runoff. Those units explicitly address the control of bacteria in stormwater runoff, and, based on the way that bacteria loads are represented in the calibrated model, they also implicitly provide some control of bacteria that may reach streams through illicit connections that contribute to baseflow.

 Indicates Revision from May 2013 Plan Amendment

## Table N-5 Footnotes

<sup>a</sup>In certain limited cases, relatively minor anomalies in concentrations or percents compliance may occur among the five conditions for which model results are presented in this table. Those anomalies might indicate a slight decrease in water quality under the recommended plan and/or "extreme measures" conditions, relative to revised 2020 baseline and/or revised 2020 baseline with five-year LOP conditions. In those cases, it may be assumed that no significant change in water quality occurs among those various conditions. Since it was not always possible to explicitly represent certain components of the recommended plan and "extreme measures" conditions in the LSPC water quality model, adjustments were made to model parameters that served as surrogates for the actual water pollution control measure being represented. In the sense that those modifications sometimes alter parameters in the revised 2020 baseline and/or revised 2020 baseline with five-year LOP model versions, in limited cases, representation of a measure in the recommended plan or "extreme measures" models may have a side effect of introducing small, relatively insignificant anomalies in the comparative results.

<sup>b</sup>Five-Year LOP refers to a five-year recurrence interval level of protection against sanitary sewer overflows.

<sup>c</sup>Within the water quality models for the recommended plan and extreme measures condition, the detection and elimination of illicit discharges to storm sewer systems and control of urban sourced pathogens, including those in stormwater runoff, are represented using stormwater disinfection units. Such units were initially considered as a recommended approach to treatment of runoff, but were eliminated from further consideration based on comments from the Technical Advisory Committee. However, the use of such units is considered to be appropriate as a surrogate representation of the varied and as yet undetermined means that would be applied to detect and eliminate illicit discharges and to control pathogens in urban stormwater runoff. Those units explicitly address the control of bacteria in stormwater runoff, and, based on the way that bacteria loads are represented in the calibrated model, they also implicitly provide some control of bacteria that may reach streams through illicit connections that contribute to baseflow.

<sup>d</sup>Under Chapter NR 104 of the Wisconsin Administrative Code, this assessment point is in a stream reach classified as capable of supporting limited forage fish.

<sup>e</sup>Under Chapter NR 104 of the Wisconsin Administrative Code, this assessment point is in a stream reach classified as capable of supporting limited aquatic life.

## Table N-6 Footnotes

<sup>a</sup>In certain limited cases, relatively minor anomalies in concentrations or percents compliance may occur among the five conditions for which model results are presented in this table. Those anomalies might indicate a slight decrease in water quality under the recommended plan and/or “extreme measures” conditions, relative to revised 2020 baseline and/or revised 2020 baseline with five-year LOP conditions. In those cases, it may be assumed that no significant change in water quality occurs among those various conditions. Since it was not always possible to explicitly represent certain components of the recommended plan and “extreme measures” conditions in the LSPC water quality model, adjustments were made to model parameters that served as surrogates for the actual water pollution control measure being represented. In the sense that those modifications sometimes alter parameters in the revised 2020 baseline and/or revised 2020 baseline with five-year LOP model versions, in limited cases, representation of a measure in the recommended plan or “extreme measures” models may have a side effect of introducing small, relatively insignificant anomalies in the comparative results.

<sup>b</sup>Five-Year LOP refers to a five-year recurrence interval level of protection against sanitary sewer overflows.

<sup>c</sup>Within the water quality models for the recommended plan and extreme measures condition, the detection and elimination of illicit discharges to storm sewer systems and control of urban sourced pathogens, including those in stormwater runoff, are represented using stormwater disinfection units. Such units were initially considered as a recommended approach to treatment of runoff, but were eliminated from further consideration based on comments from the Technical Advisory Committee. However, the use of such units is considered to be appropriate as a surrogate representation of the varied and as yet undetermined means that would be applied to detect and eliminate illicit discharges and to control pathogens in urban stormwater runoff. Those units explicitly address the control of bacteria in stormwater runoff, and, based on the way that bacteria loads are represented in the calibrated model, they also implicitly provide some control of bacteria that may reach streams through illicit connections that contribute to baseflow.

## Appendix O

# RIPARIAN BUFFER EFFECTIVENESS ANALYSIS

### INTRODUCTION

The scientific literature on the effectiveness of riparian buffers in improving water quality through processing and removing anthropogenic contaminants from surface and ground waters is extensive. Added to this literature is legal practice that has established the principle of shoreline setbacks, especially with respect to both the shoreland management of lakes and flowages and to flood control. Recently, riparian buffers have been employed as an environmental management tool. Despite significant research efforts, there remains no consensus for what constitutes optimal riparian buffer design or proper buffer width to achieve maximum pollutant removal effectiveness, water quality protection, and biological protection. The Wisconsin Buffer Initiative (WBI) further developed two key concepts that are relevant to this plan: 1) riparian buffers are very effective in protecting water resources, and 2) riparian buffers need to be a part of a larger conservation system to be most effective.<sup>1</sup> However, it is important to note that the WBI limited its assessment and recommendations solely to the protection of water quality, and did not consider the additional values and benefits of riparian buffers such as flood control, prevention of channel erosion, provision of fish and wildlife habitat, enhancement of environmental corridors, and water temperature moderation, among others.

This analysis seeks to identify documented scientific information extracted from published literature, which allowed the derivation of the recommended 75-foot-wide riparian buffer width for lakes and streams in the regional water quality management plan update study area, and by extension, the Southeastern Wisconsin Region. This will aid managers and planners in making decisions about establishing, maintaining, or restoring riparian buffers adjacent to all waterbodies. Although, buffer width stands out as one factor influencing the capacity for buffers to remove potential contaminants, numerous other factors described herein play significant roles in the establishment of 75-foot-wide riparian buffers as part of this comprehensive water quality management plan update.

More than 65 peer-reviewed scientific publications dating from 1975 through 2005 were examined for data on the effectiveness of riparian buffers for total suspended solids (TSS), nitrogen, and phosphorus removal around streams and lakes. These data form the basis for defining the relationship between buffer width and percent removal efficiencies for those contaminants. When introduced into the natural environment in quantities or

concentrations exceeding the absorption capacity of shoreland buffers, these potential pollutants have the ability to negatively impact waterways and waterbodies, diminishing their utility as recreational and aesthetic resources and reducing their value as essential elements of aquatic ecosystems.

As part of this analysis, three key elements were incorporated into the general 75-foot buffer width recommendation set forth in the regional water quality management plan update. These elements are:

- The value of riparian buffers as vegetated zones adjacent to streams, lakes, and wetlands and their use as a best management practice (BMP) for **controlling contaminants** such as nutrients and TSS entering waterbodies.
- The value of riparian buffers as habitat areas adjacent to streams, lakes, and wetlands and their use as a BMP for **protecting and maintaining species** habitat and diversity, especially amongst species of economic concern.
- The role of riparian buffers as a **component of comprehensive watershed management plans**, which must also include point source and nonpoint source control of nutrients and TSS loadings.

## CONTROL OF CONTAMINANTS

Riparian buffers are one of the most effective best management practices to protect water resources in terms of water quality, riverbank stability, wildlife habitat, and aesthetics. These strips of grass, shrubs, and/or trees along the banks of rivers, streams, and lake shorelines filter polluted runoff and provide a transition zone between the land and water and associated human uses. These buffers work in various ways and with varying degrees of effectiveness. Effectiveness depends upon a number of factors including the nature of the specific contaminant, its environmental reactivity, the mass of contaminant being conveyed across the land surface, and the distance and slope across which the contaminant is being carried. The role of buffers in controlling and managing the transfer of several major contaminants through the land-water ecotone, or interface, is briefly reviewed below.

### Sediment Filter

Riparian buffers help catch and filter out sediment and debris from surface runoff. Depending upon the width and complexity of the buffer, generally 50 percent to 100 percent of the sediment particles—as well as the nutrients and other contaminants attached to them—can settle out and be retained within the buffer strip as plants slow sediment-laden runoff waters. These buffers act as physical filters, retaining particulates within the mass of plant materials, roots, and stalks. For this purpose, wider forested buffers are even more effective than narrow grassed buffers.

### Nutrient Filter, Transformer, and Sink

Riparian buffers “trap” pollutants that could otherwise wash into surface and ground water. Such buffers act both as a physical filter, retaining contaminants that adhere to sediment particles through the settling processes described above, and as biological filters. The plants that comprise the buffer strips can utilize a portion of the nutrient load being processed through the buffer strip for nutrition and growth. Phosphorus and nitrogen from sources such as fertilizer application and animal waste can become pollutants if more is applied to the land than upland plants can use. These “excess” nutrients can be transported by runoff of rainfall or snowmelt to aquatic systems, such as streams and lakes where the nutrients are then available to support and sustain the growth and reproduction of shoreland and aquatic plants. In large quantities, these plants commonly limit recreational use of the waters and shorelands, and interfere with the aesthetic enjoyment of these areas.

Phosphorus stimulates growth (i.e. it is a growth limiting element) of both terrestrial and aquatic plants in the Southeastern Wisconsin Region, and is largely responsible for the eutrophication of our waterbodies. The affinity of this element to soil particles results in approximately 80 percent or more of the available phosphorus being captured when sediment is filtered out of surface runoff by passing through the buffer.

In the case of nitrogen, another important element for plant growth, the chemical and biological activity in the soil, particularly in the soils of streamside forests, can capture and transform nitrogen and other pollutants into less biologically-available forms. Nitrogen-fixing bacteria are especially useful in capturing “excessive” nitrogen and transforming the elemental nitrogen into biologically available and/or gaseous forms.

It should be noted that, with respect to aquatic systems, the vegetation within the buffers acts as a temporary sink as the nutrients and excess water are taken up by root systems and stored in the biomass of trees during the growing season. A large portion of these nutrients are then re-released into the environment during the autumn as the plants senesce or die; however, nutrients entering the aquatic environment during the fall are less likely to create or contribute to conditions that interfere with human recreational use and aesthetic enjoyment of the downstream water resources.

### **Stream Flow Regulator**

Riparian buffers slow the passage of water across the land surface and allow water to infiltrate into the soil. This recharge contributes to the maintenance of the groundwater supply. Groundwater reaches streams and rivers at a much slower rate, and over longer periods of time, than surface runoff. Thus, increasing recharge helps maintain stream flow during the driest times of the year.

### **Bed and Bank Stabilizer**

Riparian buffer vegetation helps to stabilize streambanks and shorelines and reduce erosion. The roots of the plants hold bank soils together, and the stems protect banks by deflecting the erosive action of waves, ice, boat wakes, and storm runoff. In like manner, riparian buffers also can reduce the amount of streambed scour by absorbing surface water runoff and slowing water velocities. When plant cover is removed, more surface water reaches a stream, causing the water to crest higher during storms or snowmelt, and subjecting the shorelands to higher flow velocities that can scour shorelines and streambeds.

### **Effectiveness of Shoreland Buffers**

The following range of buffer widths can be gleaned from the literature:

- **To Stabilize Eroding Banks:** On smaller streams, good erosion control may only require covering the banks with shrubs and trees, and a 35-foot-wide managed grass buffer. If there is active bank erosion, or on larger streams, at least a 50-foot width is necessary. Severe bank erosion on larger streams may require engineering actions to stabilize and protect the bank; however, once completed, bank protection can be done with plants. For better stabilization, more of the buffer should be planted in shrubs and trees.
- **To Filter Sediment and Attached Contaminants from Runoff:** For slopes of less than 15 percent, most sediment settling occurs within a 35-foot-wide buffer of grass. Greater width is needed on steeper slopes, for shrubs and trees, or where sediment loads are particularly high.
- **To Filter Dissolved Nutrients and Pesticides from Runoff:** A width of up to 100 feet or more may be necessary on steeper slopes and on less permeable soils to allow runoff to soak in sufficiently, and for vegetation and microbes to work on nutrients and pesticides. Most pollutants are removed within 75 feet.

Based upon the literature review, for the purposes of contaminant management, a buffer width of 75 feet represents the most appropriate width for water quality protection. As shown in Figures O-1 through O-4, and consistent with the water quality modeling assumptions applied for the regional water quality management plan update, a 75-foot buffer width provides a high level of effectiveness in reducing TSS loads delivered to the buffer by about 75 percent, delivered total nitrogen loads by about 65 percent, delivered nitrate loads by about 75 percent, and delivered total phosphorus loads by about 70 percent. There are increased benefits of reduction beyond the 75-foot width for each of these parameters. For example, about 90 percent removal effectiveness would be expected for both nitrate and total phosphorus at approximately a 300-foot buffer width. Coincidentally,

Figure O-4

Source: SEWRPC.

this 300-foot buffer width is well within the range for added biological community benefits as described below. However, examination of Figures O-1 through O-4 indicates that for a relatively high cost, as indicated by the incremental buffer width beyond 75 feet, a relatively small improvement in water quality would be achieved, as indicated by the incremental increase in pollutant removal effectiveness beyond that for the 75-foot buffer.

It should also be noted that buffer effectiveness is determined by slope, soil permeability, and nature of vegetative cover. Steep slopes and soils of low permeability have less capacity to provide water quality benefits and therefore, require greater buffer widths than less steeply sloped and more permeable soils. Steeply sloped lands promote rapid runoff of water and associated contaminants, while less permeable soils limit infiltration and interflow. Studies show that subsurface flows provide more effective pollutant removal capacity than surface runoff flows.<sup>2</sup> However, the effectiveness and efficiency of all buffers can be limited by the extent of contaminant loading, with even the largest buffers having reduced effectiveness under conditions of extremely high loadings. Thus, a system of riparian buffers along with agricultural nutrient management plans and urban stormwater management plans is recommended under the regional water quality management plan update to provide effective control of nonpoint source pollution.

The nature of vegetated cover within the buffer also will determine in part the magnitude of nutrient removal based upon: the requirements of specific plants primarily for nitrogen and phosphorus necessary for growth; the season, with the majority of removal occurring during the growing season; and the degree of physical filtration, with more densely packed stems typically slowing runoff and retaining a greater percentage of soil bound pollutants. Seasonality in terms of both plant growth cycles and freeze thaw cycles can influence the net effectiveness of pollutant removal, with plants actively taking up or removing nutrients in the spring and summer and releasing those nutrients during the fall when plants senesce, while frozen ground limits the ability of water to infiltrate during the winter months reducing the percentage of uptake of nutrients.<sup>3</sup> Modifying the timing and rate of delivery of contaminants to aquatic systems can significantly modify undesirable biological responses in receiving waters such as lakes and streams.

## BIOLOGICAL PROTECTION

Riparian buffers can be complex ecosystems that provide habitat and improve the stream and lake communities that they shelter. Habitat and riparian corridor conditions are strongly influenced by the width and nature of the buffers adjacent to a waterbody and are an important BMP with regard to protecting water from contamination by nonpoint source pollutants, as previously noted. There are many different kinds of buffers. While these buffers may be applied to a variety of situations and may be called by different names, their functions are much the same—the improvement and protection of surface water and groundwater quality; reduction of erosion on croplands, streambanks, and lakeshores; and, provision of protection and cover for insects, fish, birds, amphibians, reptiles, and mammals. The types of riparian buffers include, but are not limited to: streamside or lakeshore plantings of trees, shrubs, and grasses; filter strips or grassed waterways; and undisturbed shoreland vegetation.

Field, “Direct and Indirect Influences on Aquatic Macrophyte Communities on Phosphorus Mobilization from Littoral Sediments of an Inlet Region in Lake Delavan, Wisconsin,” U.S. Army Corps of Engineers, Technical Report W-95-2, September 1995.

## **Wildlife Habitat**

The distinctive habitat offered by riparian buffers is home to a multitude of plant and animal species, including those rarely found outside of this band of land influenced by a river or lake. Continuous stretches of riparian buffer serve as wildlife travel corridors. Consequently, streambanks and lakeshores form integral elements of the environmental corridor concept developed and implemented within the Region in accordance with the regional land use and natural areas and critical species habitat protection and management plans.

## **Aquatic Habitat**

Riparian buffers benefit aquatic habitat by improving the quality of nearby waters through shading, filtering, and moderating stream flow. Trees and shrubs provide shade during the summer months, maintaining cooler and more even water temperatures, especially along small streams. Cooler water holds more oxygen and reduces stress on fish and other aquatic creatures. A few degrees difference in temperature can have a major effect on their survival. High value species, such a trout, for example, require cooler water temperatures for survival and reproduction.

The woody debris generated from within the riparian buffer supports the aquatic food web by providing food and cover for fish and their food organisms. By slowing water velocities, providing substrate for insects, among other benefits the woody debris encourages a range of organisms within a system that would be less diversely populated if it did not contain woody debris.

## **Recreation and Aesthetics**

Riparian buffers are especially valuable in providing a green screen along waterways, blocking views of nearby development, and allowing privacy for riverfront landowners. Buffers also provide such recreational opportunities as hiking trails. For many humans, it is these attributes of riparian buffers that are most obvious and most enjoyable.

## **To Protect Fisheries**

Research has shown that a minimum 100-foot buffer width is required to protect the quality and health of the aquatic food web.<sup>4</sup> However, the highest quality fishery communities were associated with the widest riparian buffers that ranged from approximately 650-3,000 feet in width, which indicates that buffer widths greater than 100 feet continue to provide additional protection benefits to the fishery community. Regardless of the type of fishery, the 100-foot minimum is a relevant buffer width standard to protect and maintain a coldwater, coolwater, or warmwater fishery and associated aquatic community. The quality of these communities improves with increases beyond the minimum buffer width. In addition, research also has shown that impacts to the continuity and fragmentation of the riparian corridor buffer width are equally as important in protecting aquatic communities. Similarly, both width and continuity of undisturbed buffer strips were related positively to stream health as indicated by aquatic insect IBI, aquatic insect species richness, fisheries Index of Biotic Integrity (IBI), and trout presence.<sup>5</sup> These researchers found that stream health was generally well protected with riparian buffers that ranged from about 110-130 feet in width, contained less than 13 fragments per kilometer (e.g., number of road crossings or some equivalent per length of buffer), and at least 31 percent of the buffer was comprised of 100 feet or more in width. As shown in Figure O-5, stream health (i.e. aquatic insect IBI) and buffer characteristics were linearly related where stream health improves with buffer width from about 50 to 160 feet in width. Narrow buffers having some fragmentation had modest effects on reducing stresses to stream health, whereas wide buffers

without fragmentation had substantial effects. Consistent with these findings related to stream health, the regional water quality management plan update includes a recommendation that opportunities to expand riparian buffers beyond the recommended 75-foot width be pursued along high-quality stream systems including those designated as outstanding or exceptional resource waters of the State, trout streams, or other waterways that support and sustain the life cycles of economically important species such as salmon, walleye, and northern pike.

Land use within the watershed also is an important variable influencing fish and macroinvertebrate abundance and diversity, which is why riparian buffers alone cannot address the stresses of excessive nutrient loading, stormwater runoff, or other nonpoint source pollution. For example, researchers found that combined upland (barnyard runoff controls, manure storage, and contour plowing and reduced tillage) and riparian (streambank fencing, streambank sloping, limited streambank riprapping) Best Management Practices (BMPs) treatments significantly improved overall stream habitat quality, bank stability, instream cover for fishes, and fish abundance and diversity.<sup>6</sup> Specifically, improvements were most pronounced at sites with riparian BMPs; however, in sites with limited upland BMPs installed in the watershed there were no improvements in water temperature or the quality of fish community. The regional water quality management plan update recommends buffers as part of an overall system of agricultural controls such as those listed above.

### To Protect Wildlife Habitat

Buffer widths for wildlife depend upon the desired species to be protected. As shown in Figure O-6, large streamside forest buffer widths of up to 350 feet are needed for wildlife habitat purposes in contrast to those required for protection of water quality. The larger the buffer zone, the more valuable it is as wildlife habitat.

<sup>6</sup>Lizhu Wang, John Lyons, and Paul Kanehl, "Effects of watershed best management practices on habitat and fish in Wisconsin streams," *Journal of the American Water Resources Association*, Vol. 38, No. 3, 663-680, June 2002.

buffer or for the protection of a particular species as shown in Figure O-6. Buffers that have widths in the 15- to 35-foot range generally provide limited water quality benefit and minimal protection of aquatic resources under most conditions. Under most circumstances, a minimum buffer width of about 50 to 100 feet is necessary to protect wetlands and streams. In general, minimum buffer widths in the 50- to 65-foot range would be expected to provide for the maintenance of the natural physical and chemical characteristics of aquatic resources. Buffer widths at the upper end of the 50- to 100-foot range seem to be necessary for the maintenance of the biological components of many wetland and stream systems, although it is important to note that site-specific conditions, such as slope, vegetation, and soil characteristics, can greatly influence the need for either wider or narrower buffers. Based upon the literature review, for the purposes of habitat management, a buffer width of 75 feet represents the minimum width necessary for provision of protection of aquatic organisms and habitat. However, a buffer of only 75 feet is not adequate to protect all aquatic and terrestrial plant and animal species.

It is clear that "one size does not fit all" with regard to riparian buffers. Buffer width depends on the purpose which the buffer is meant to serve. There is no single generic buffer which will keep the water clean, stabilize the bank, protect the fish and wildlife, and satisfy human demands. The minimum acceptable width is one that will provide acceptable levels of all of these beneficial uses at an acceptable cost. Consequently, a basic buffer should be about 75 feet from the top of the bank at the water's edge.

In practice, the size and vegetation of the buffer should match the land use and topography of the site.

- **Topography:** A buffer is more important for water quality in areas that collect runoff and deliver it to streams, and less critical on lands that drain away from the water. Steeper slopes call for a wider riparian buffer to allow more opportunity for the buffer to capture pollutants from faster moving runoff.

Larger animals—such as fox, deer, raccoon, and large birds of prey—and interior forest species—especially forest dwelling birds that require deep forest habitat—generally require more room. Additionally, the diversity of various sedges, grasses, forbs, shrubs, and trees may be dependent upon the area available for seed dispersal, germination, and growth. Nevertheless, a narrow width and reduced diversity of vegetation may be acceptable as a travel corridor if connected to larger diverse areas of habitat. Even small patches of trees are better for migrating birds than no buffer or monotypical stands such as lawns or crops. These wildlife buffer concepts underlie the primary environmental corridor specifications of a 200-foot minimum width and two mile length<sup>7</sup>

## SYNTHESIS

Buffers can be used for a variety of purposes from enhancing aquatic species diversity through reducing water temperature entering streams to enhancing terrestrial species diversity through the provision of safe passages with adequate food and shelter. For these reasons, buffer size may vary widely, depending on the specific functions required for a particular

<sup>7</sup>Paul Beier and Reed F. Noss, "Do Habitat Corridors Provide Connectivity?," *Conservation Biology*, Review, Vol. 12, No. 6, 1241-1252, December 1998.

- Hydrology and Soils: The ability of the soil to remove pollutants and nutrients from surface and ground water depends upon the type of soil, its depth, and relation to the water table. On wetter soils, a wider buffer is needed to achieve the same benefit.
- Vegetation: The purposes of the buffer will influence the type of vegetation to plant or encourage. In urban and residential areas, trees and shrubs do a better job at capturing pollutants from parking lots and lawn runoff and providing visual screening and wildlife habitat. Between croplands and waterways, a buffer of shrubs and grasses can provide many of the benefits of a forested buffer without shading crops, although trees can be used on the north side of fields. Trees have several advantages over other plants in improving water quality and offering habitat. Trees are not easily smothered by sediment and have greater root mass to resist erosion. Above ground, they provide better cover for birds and other wildlife using waterways as migratory routes. Trees can especially benefit aquatic habitat on smaller streams. In general, native vegetation is preferable to nonnative plants.

## CONCLUDING REMARKS

While it is clear from the literature that wider buffers can provide a greater range of values for aquatic systems, the need to balance human access and use with the environmental benefits to be achieved suggests that a 75-foot-wide riparian buffer provides a minimum width necessary to contribute to good water quality and a healthy aquatic ecosystem. In general, most pollutants are removed within a 75-foot buffer width. While water quality benefits increase somewhat when buffers exceed the 75-foot width, such increases in width are increasingly less cost effective as a smaller portion of the total pollutant load is removed at a significantly higher cost. From an ecological point of view, buffers beyond a 75-foot width provide greater benefits.

These findings form the basis for the Washington County shoreland protection program, for example, and underlie many of the other shoreland ordinances adopted elsewhere in Wisconsin. A 75-foot buffer width is consistent with the required shoreland setbacks set forth in Chapter NR 115 of the *Wisconsin Administrative Code*, and with other recommended setbacks currently included within legal definitions of the shoreland area. Thus, a 75-foot wide buffer appears to be the best and most practical compromise between human use of the landscape and the needs of the environment that sustain such human uses. However, the quality and continuity of these corridors play important roles in their effectiveness, with greater levels of fragmentation by roadways and other structures limiting the effectiveness of those buffers that are put into place.

## **Appendix P**

# **CRITERIA AND GUIDELINES FOR STREAM CROSSINGS TO ALLOW FISH PASSAGE AND MAINTAIN STREAM STABILITY WITHIN THE REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE STUDY AREA**

### **TYPES OF CROSSINGS**

- The number of stream crossings should be minimized.
- If a crossing is necessary, structures that maintain to the extent possible the existing streambed and bank conditions are preferable; therefore, bridges spanning streams are preferable to other structures.
- If a culvert is necessary, open bottom structures are preferable to closed bottom structures.
- If a closed bottom culvert is necessary, box culverts, elliptical, or pipe arch culverts are preferable to round pipe culverts, because round pipes generally reduce stream width to a much larger degree than the aforementioned structures, causing long term upstream and downstream passage limitations (see physical considerations below).

### **BIOLOGICAL CONSIDERATIONS<sup>1</sup>**

- Contact the area WDNR fisheries manager prior to design.<sup>2</sup>
- Species of fish present (coldwater, warmwater, threatened, endangered, species of special concern).
- Life stages to potentially be impacted (e.g., egg development within substrates should be avoided).
- Migration timing of affected species/ life stages (e.g., adult spawning times should be avoided).

---

<sup>1</sup>*British Columbia Ministry of Forests, Fish-stream crossing guidebook, For. Prac. Br., Min. For., <http://www.for.gov.bc.ca/tasb/legsregs/fpc/FPCGUIDE/Guidetoc.htm>, Victoria, B.C. Forest Practices Code of British Columbia guidebook, 2002.*

<sup>2</sup>*UW-Extension and WDNR, Fish Friendly Culverts, 2002.*

## PHYSICAL CONSIDERATIONS<sup>3</sup>

It is important to note that in order to achieve the minimum physical criteria outlined below, the culvert(s) will need to be oversized as part of the design to ensure adequate long-term fish passage as well as the ability to pass the design period rainfall event.

It is understood that it may not be possible to achieve some of the minimum passage criteria below based upon specific on-site conditions or constraints, however, the closer the designed and completed culvert can meet these criteria the better the long-term passage and overall sustainability of the fishery will be achieved in this region.

### Provide Adequate Depth

- Slope—Culvert should be installed with a slope that matches the riffle slope as measured in the thalweg<sup>4</sup> (see Minnesota DNR guidelines<sup>5</sup>)
- Water Depth—Depths should maintain the determined thalweg depth at any point within the culvert during low flow periods (see Minnesota DNR guidelines).
- Installation Below Grade—The culvert should be installed so that the bottom of the structure is buried to a depth equal to 1/6th the bankfull width of the stream (up to two feet) below the natural grade line elevation of the stream bottom (see Minnesota DNR guidelines). The culvert should then be filled to stream grade with natural substrates. The substrates should consist of a variety of gravel ranging from one to four inches in diameter and either mixed with nonuniformly laid riprap or uniformly placed alternate riprap baffles, large enough to be stable during the culvert design discharge, which will ensure stability of substrates during high flow events.

### Provide Adequate Width

- Width—Culvert width shall match the bankfull width (minimum) of the existing channel.
- Offsetting Multiple Culverts—The number culverts used should be minimized. However, if multiple culverts are necessary, it is recommended that the culvert inverts be offset vertically and only one culvert be designed to provide passage during low flow conditions and the additional culverts be used to pass the higher flow events (see Figure P-1). Therefore, the low flow culvert will be the only culvert, in a series of two or more culverts, designed to provide fish passage during low flows and shall meet the physical requirements of passage above.

### Provide Adequate Resting Areas

- Length—Culverts that exceed more than 75 feet in length need to provide additional resting areas (e.g., installation of baffles or weirs) within the culvert to facilitate passage.<sup>6</sup>

Figure P-1

COMPARISON OF UNDERSIZED AND ADEQUATELY SIZED AND PLACED CULVERTS

Source: Minnesota Department of Natural Resources.

**Inlet and Outlet Protection**

- Align the culvert with the existing stream alignment (e.g., 90 degree bends at the inlet or outlet should be avoided, even though this will increase culvert length, see Minnesota DNR guidelines).
- The low flow culvert should be centered on the thalweg of the channel to ensure adequate depths inside the culvert.
- Provide grade control where there is potential for head-cuts that could degrade the channel.
- It may be necessary to install riprap protection on the outside bank below the outlet to reduce bank erosion during high flow events.

## Appendix Q

# RECOMMENDED INLAND LAKE MANAGEMENT MEASURES

### INTRODUCTION

Lakes are unique features of the landscape, being repositories of materials transported from the land surface and conveyed by streams and rivers into their basins, as well as significant recreational, aesthetic, and environmental resources. The major lakes of the greater Milwaukee watersheds are relatively unique within the Region in that they are generally headwater lakes, situated within the drainage system tributary to the mainstem of the Milwaukee River system. These waterbodies include Auburn Lake, Crooked Lake, Forest Lake, Kettle Moraine Lake, Long Lake, Mauthe Lake, and Mud Lake in Fond du Lac County; Mud Lake and Spring Lake in Ozaukee County; Lake Ellen and Random Lake in Sheboygan County; and Barton Pond, Big Cedar Lake, Green Lake, Lake Twelve, Little Cedar Lake, Lucas Lake, Silver Lake, Smith Lake, and Wallace Lake in Washington County. Where available, water quality-related data on these lakes are set forth in Chapter VII, “Surface Water Quality Conditions and Sources of Pollution in the Milwaukee River Watershed,” of SEWRPC Technical Report No 39 (TR No. 39), *Water Quality Conditions and Sources of Pollution in the Greater Milwaukee Watersheds*, which is a companion document to this report. While relatively few data were available for the majority of the lakes, the available data indicated that these waterbodies could be considered to be mesotrophic to eutrophic in nature, or enriched with the plant nutrients nitrogen and phosphorus and capable of supporting abundant growths of aquatic plants and sustaining a productive fishery, albeit one likely to become increasingly dominated by pollution tolerant fishes.

Given this status, the adopted regional water quality management plan,<sup>1</sup> as refined by the plans derived from the Milwaukee River Priority Watersheds Program,<sup>2</sup> recommended that nutrient loads to the lakes of the greater

---

<sup>1</sup>See *SEWRPC Planning Report No. 30*, A Regional Water Quality Management Plan for Southeastern Wisconsin—2000, Volume Two, Alternative Plans, February 1979; see also *SEWRPC Memorandum Report No. 93*, A Regional Water Quality Management Plan for Southeastern Wisconsin: An Update and Status Report, March 1995.

<sup>2</sup>Wisconsin Department of Natural Resources Publication No. PUBL-WR-255-90, A Nonpoint Source Control Plan for the East and West Branches of the Milwaukee River Priority Watershed Project, February 1989; Wisconsin Department of Natural Resources Publication No. PUBL-WR-253-90, A Nonpoint Source Control Plan for the North Branch Milwaukee River Priority Watershed Project, July 1989; Wisconsin Department of Natural Resources Publication No. PUBL-WR-245-91, A Nonpoint Source Control Plan for the Milwaukee River South Priority Watershed Project, December 1991; Wisconsin Department of Natural Resources Publication No. PUBL-WR-336-93, Nonpoint Source Control Plan for the Cedar Creek Priority Watershed Project, August 1993. See also *SEWRPC Planning Report No. 9*, A Comprehensive Plan for the Root River Watershed, September 1966; *SEWRPC Planning Report No. 36*, A Comprehensive Plan for the Oak Creek Watershed, August 1986.

Milwaukee watersheds be minimized by application of nonpoint source pollution control measures designed to reduce pollutant loads to the lakes from rural lands by up to 75 percent, in the case of Lake Twelve, and by up to 50 percent from urban lands, in the case of the Kelly Lakes. For this reason, implementation of the watershed management measures set forth elsewhere in this report will complement and contribute to the control of nonpoint source pollution loading to the lakes, benefiting not only the streamcourses themselves, but also the lentic waterbodies within the greater Milwaukee watersheds. Thus, the general recommendations regarding water quality management and nonpoint source pollution control, set forth in Chapter X of this report are incorporated herein by reference.

The regional water quality management plan update and status report further recommended that lake specific management plans be prepared for the waterbodies within the greater Milwaukee watersheds.<sup>3</sup> These plans would present lake-specific inventory data for the direct and total drainage basins tributary to the 20 lakes and address both drainage basin and in-lake issues of concern. Appropriate in-lake water quality monitoring, aquatic plant surveys, and fisheries surveys would form part of these planning programs. Based upon the current knowledge of water quality conditions in these waterbodies, set forth in the regional water quality management plan update, and in summary form in Chapter VII of TR No. 39, it is likely that the range of issues to be addressed in such local-level plans would include watershed-based management measures designed to address nutrient loading from both public sewage treatment facilities and onsite sewage disposal systems, rural agricultural lands, and urban lands and construction sites; aquatic plant management; fisheries management; lake depth and sedimentation; and, in the case of impounded waterbodies, lake-level management. Identification and protection of environmental corridors, including riparian wetlands, as recommended in the adopted regional land use plan, regional natural areas and critical species habitat protection and management plan, and county land and water resource management plans, would also be likely issues of concern to be addressed in lake-specific management planning programs.<sup>4</sup>

This appendix sets forth a summary of the lake-specific plan elements applicable to the major lakes of the greater Milwaukee watersheds, based upon consideration of the inventory data presented in the report. While these recommendations are made for the 20 major lakes, similar recommendations should be considered for application to lakes of less than 50 surface acres in areal extent, such as the Kelly Lakes and the Milwaukee County ponds and lagoons,<sup>5</sup> where such measures are deemed important for purposes of water quality protection.

As of 2006, lake management plan elements had been prepared for three of the major lakes—Big Cedar Lake, Little Cedar Lake, and Silver Lake, all in Washington County—and two of the minor lakes—Upper and Lower Kelly Lakes in Milwaukee and Waukesha Counties.<sup>6</sup>

(Footnote Continued on Next Page)

### County Lake and Stream Classification Programs

During 1997, the Wisconsin Legislature created a lake classification grant program as described under Chapter NR 191 of the *Wisconsin Administrative Code*. This cost-share program was to be administered by the Wisconsin Department of Natural Resources (WDNR) as part of the existing Lake Protection Grant Program, and was intended to further the degree of protection of lakeshore areas within the State. Both Washington County and Waukesha County in the greater Milwaukee watersheds successfully applied for funds under this program and completed lake and stream classification projects. In terms of Washington County, this project complemented efforts by the County to recodify their shoreland, floodland, and shoreland wetland ordinances. Washington County utilized a process that resulted in the compilation of a physical and chemical description and a resource value and use assessment for each waterbody inventoried, organized by Public Land Survey township so as to be most useful to local governments tasked with adopting and implementing local zoning systems. Available data on all of the major lakes with surface areas of 50 acres in areal extent or greater and the perennial streams were collected and analyzed during this process. In addition, data on many of the minor lakes and streams were also included in this inventory process.<sup>7</sup> Waukesha County used a similar process, with the inventory data being organized according to waterbody name.<sup>8</sup> Waukesha County has not adopted a classification system within its shoreland zoning ordinance. The recommendations of the Washington and Waukesha County lake and stream classification projects are incorporated by reference in the regional water quality management plan update.

As shown on Map Q-1, within the Milwaukee River watershed in Washington County, the following major and minor lakes were included in the classification system: Allis Lake, Big Cedar Lake, Boltonville Millpond, Brickyard Lake, Ehne Lake, Erler Lake, Gilbert Lake, Green Lake, Hackbarth Lake, Hasmer Lake, Hawthorn Lake, Keown Lake, Kewaskum Millpond, Lehner Lake, Lent Lake, Little Cedar Lake, Little Drickens Lake, Lucas Lake, Newburg Pond, Proschinger Lake, Quaas Lake, Radtke Lake, Silver Lake, Smith Lake, Tily Lake, Lake Twelve, and Wallace Lake. Of these waterbodies, Gilbert Lake, Kewaskum Millpond, Lehner Lake, and Newburg Pond were ranked as Class I and recommended to be subject to the highest levels of protection. These protections included limits on impervious area, increased setbacks, and related measures designed to minimize the impacts of development on the waterbodies. Allis Lake, Boltonville Millpond, Brickyard Lake, Ehne Lake, Erler Lake, Hackbarth Lake, Hasmer Lake, Hawthorn Lake, Keown Lake, Lent Lake, Little Drickens Lake, Lucas Lake, Proschinger Lake, Quaas Lake, Radtke Lake, Smith Lake, and Tily Lake were ranked as Class II and recommended to be subjected to an intermediate level of protections. Recommended setbacks were greater than the statewide minimum, for example. Class II was the default class into which any new entrants into the classification pool would be placed, unless there was documentation to support their placement into one of the other classes. The balance of the lakes, including most of the larger lakes in the Milwaukee River watershed in Washington County, were placed into Class III, which conforms to the statewide minimum requirements for shoreland protection.

Within the greater Milwaukee watersheds in Waukesha County, there are no major lakes, although several minor lakes were included in the classification system. Lower and Upper Kelly Lakes, in the Root River system, are the only named lakes within the study area that were included in this inventory. Lower Kelly Lake was utilized as an example of the application of various alternative classification systems outlined within the report, generally being proposed to be classified as a Class I waterbody under each of the alternative systems. As in Washington County, Class I was used to designate those waterbodies that should receive a higher degree of protection than currently afforded under the statewide minimum shoreland protection requirements.

Map Q-1

LAKE CLASSIFICATION IN WASHINGTON COUNTY WITHIN THE MILWAUKEE RIVER WATERSHED

## DESCRIPTIONS OF MAJOR AND SELECTED MINOR LAKES AND PAST LAKE MANAGEMENT RECOMMENDATIONS

### Major Lakes

#### ***Auburn Lake***

Auburn Lake, in the Town of Auburn in Fond du Lac County, is a drainage lake, discharging to a tributary to the Milwaukee River. Inflow to the Lake is through Lake Fifteen Creek. The Lake has a surface area of about 107 acres, with a maximum depth of 29 feet, and a shoreline development factor of about 1.7.<sup>9</sup> The lands draining to the Lake are dominated by a marsh bog, which comprises about one-half of the shoreline of the Lake, portions of which are located within the Northern Unit of the State-owned Kettle Moraine State Forest. The Lake itself is comprised of two distinct basins connected by a shallow, relatively narrow channel. The location of the Lake adjacent to the Kettle Moraine State Forest provides an opportunity for the implementation of management measures to reduce nutrient inputs to the Lake through the maintenance of the natural landscape. The presence of park staff also provides the opportunity to control litter and macropollutants within the drainage area. Implementation of drainage basin-scale measures to limit the inflow of runoff to the Lake from the surrounding developed lands remains a potential issue of concern, including measures affecting discharges from the roadways and parking areas. The East and West Branches of the Milwaukee River Priority Watershed Plan recommended no additional reductions in phosphorus loading or suspended sediment deliveries to Auburn Lake.

#### ***Barton Pond***

Barton Pond, in the City of West Bend in Washington County, is an impoundment on the mainstem of the Milwaukee River. The Pond was originally created as a stone and timber dam to provide power to run a feed and flour mill. The Pond is comprised of a single, elongated basin, with a surface area of about 51 acres, a maximum depth of seven feet, and a shoreline development factor of about 1.2. The lands draining to the Pond include both urban residential and industrial lands which abut the western and eastern shores of the waterbody, respectively. This urban-density development is served by a public sanitary sewerage system, as recommended in the adopted regional water quality management plan. Urban runoff from lands surrounding the Pond remains a potential concern and the implementation of drainage basin-scale measures to limit the inflow of stormwater runoff to the Pond from the urbanized portion of the drainage basin is likely to benefit this waterbody. A 25 percent reduction in urban nonpoint source pollutant loads to the Pond was recommended in the initial regional water quality management plan. The East and West Branches of the Milwaukee River Priority Watershed Plan refined this recommendation to an approximately 35 percent reduction in suspended sediment delivery to Barton Pond through the application of urban management practices in the West Bend metropolitan area.

#### ***Big Cedar Lake***

Big Cedar Lake, in the Town of West Bend in Washington County, forms the headwaters of, and drains to, Cedar Creek. Big Cedar Lake has a surface area of about 1,004 acres, with a maximum depth of 105 feet, and a shoreline development factor of about 2.25. The lands draining to Big Cedar Lake include both urban residential lands and rural, formerly agricultural lands, with residential lands comprising the major portion of the riparian lands to the Lake. The urban residential lands are currently served by onsite sewage disposal systems. The control of urban nonpoint source pollutants is a potential issue of concern and the implementation of drainage basin-scale measures to limit the inflow of runoff to the Lake from the urbanized portion of the drainage basin is likely to benefit this lake. The Big Cedar Lake Protection and Rehabilitation District has implemented a series of lake management actions in concert with other nongovernmental organizations and governmental agencies within the watershed to manage stormwater and protect lake water quality. As of 1995, the Lake also was being monitored

---

<sup>9</sup>*Shoreline Development Factor (SDF) is the ratio between the actual circumference of a lake and the circumference of a circle with the same radius. A higher number indicates a more irregular lakeshore as the shoreline length is greater than the circular reference. The lower the number, the more circular a lake is in shape. A circular lake would have a SDF of 1.0, while a dendritic lake would have a SDF of greater than 1.0. SDF is related to the amount of shoreline available for development, with more irregular shorelines offering more shoreline length along which development could occur.*

by a volunteer under the WDNR Self-Help Monitoring Program. Both urban and rural nonpoint source pollution abatement measures are likely to be warranted in this drainage basin. To this end, a 25 percent reduction in both urban and rural nonpoint source pollutant loads to the Lake was recommended in the initial regional water quality management plan. The Cedar Creek Priority Watershed Plan refined this recommendation as a 30 percent reduction in suspended sediment delivery to Big Cedar Lake. Implementation of the stormwater management practices identified by SEWRPC, specifically the construction of stormwater management basins in the vicinities of STH 33/144 and STH 144, were estimated to accomplish an approximately 30 percent reduction in nonpoint source contaminants delivered to Big Cedar Lake.<sup>10</sup> The Big Cedar Lake Protection and Rehabilitation District has implemented those recommended measures.

### ***Crooked Lake***

Crooked Lake, in the Town of Auburn in Fond du Lac County and Town of Scott in Sheboygan County, drains to the East Branch of the Milwaukee River. Crooked Lake lies largely within the Northern Unit of the State-owned Kettle Moraine State Forest. The Lake has a surface area of about 65 acres, a maximum depth of 34 feet, and a shoreline development factor of about 1.8. The Crooked Lake Wetlands Marsh forms a substantial portion of the lakeshore and is a designated State Natural Area. The inlet to Crooked Lake provides a spawning ground for northern pike while the outlet forms a small tributary to the East Branch of the Milwaukee River. The control of nonpoint source pollution from onsite sewage disposal systems is not an issue of concern, and the location of the Lake within the Kettle Moraine State Forest provides an opportunity for the implementation of management measures to reduce nutrient inputs to the Lake through the maintenance of the natural landscape. The presence of park staff also provides the opportunity to control litter and macropollutants within the drainage area. The East and West Branches of the Milwaukee River Priority Watershed Plan recommended a 25 percent reduction in suspended sediments.

### ***Lake Ellen***

Lake Ellen, in the Town of Lyndon in Sheboygan County, drains to Chambers Creek, a tributary to the North Branch of the Milwaukee River. Lake Ellen lies adjacent to the urbanized area of the Village of Cascade. The Lake has a surface area of about 121 acres and a maximum depth of 42 feet. Control of nonpoint source pollution from onsite sewage disposal systems was an issue of concern, as was the control of urban nonpoint source pollutants. The North Branch of the Milwaukee River Priority Watershed Plan recommended a 50 percent reduction in phosphorus load and a 30 percent reduction in suspended solids in Nichols Creek downstream of the Lake Ellen outlet. A similar reduction in suspended sediments and a 25 percent reduction in the phosphorus load upstream of Lake Ellen from both rural and urban sources also were recommended.

### ***Forest Lake***

Forest Lake, in the Town of Auburn in Fond du Lac County, is a “kettle” lake located within the Northern Unit of the State-owned Kettle Moraine State Forest. The Lake is a seepage lake with a surface area of about 51 acres, a maximum depth of 32 feet, and a shoreline development factor of about 1.3. The lands draining to the Lake are largely in public ownership, although a small residential community exists in the vicinity of the waterbody. The control of nonpoint source pollution from onsite sewage disposal systems is not an issue of concern, and the location of the Lake within the Kettle Moraine State Forest provides an opportunity for the implementation of management measures to reduce nutrient inputs to the Lake through the maintenance of the natural landscape. The presence of park staff also provides the opportunity to control litter and macropollutants within the drainage area. The East and West Branches of the Milwaukee River Priority Watershed Plan recommended no additional reductions in phosphorus loading or suspended sediments delivery to Forest Lake.

---

<sup>10</sup>*SEWRPC Memorandum Report No. 137, A Water Quality Protection and Stormwater Management Plan for Big Cedar Lake, Washington County, Wisconsin, Volume Two, Stormwater Management Plans for Three Pilot Subbasins, August 2001.*

### ***Green Lake***

Green Lake, in the Town of Farmington in Washington County, is a small, elongate, seepage lake formed as a remnant of a large glacial lake in the area of the Lake Michigan terminal moraine. The Lake has a surface area of about 82 acres, a maximum depth of 35 feet, and a shoreline development factor of about 1.6. The lands surrounding the Lake are largely developed for urban-density residential use. A 25 percent reduction in rural nonpoint source pollutant loads to the Lake is recommended in the initial regional water quality management plan. The East and West Branches of the Milwaukee River Priority Watershed Plan refined this recommendation as a 30 percent reduction in phosphorus loading to Green Lake.

### ***Kettle Moraine Lake***

Kettle Moraine Lake, in the Town of Osceola in Fond du Lac County, is a shallow, fertile lake draining into Mud Lake, also in Fond du Lac County, and ultimately into the Milwaukee River. The Lake is surrounded by an extensive area of wetland, and is adjacent to the Northern Unit of the State-owned Kettle Moraine State Forest. Kettle Moraine Lake has a surface area of about 227 acres, a maximum depth of 30 feet, and a shoreline development factor of about 1.1. The Lake is reported to be subject to significant fluctuations in water level, contributing to fish kills, including winter kills, which have been reported at irregular intervals since 1951. The East and West Branches of the Milwaukee River Priority Watershed Plan recommended no additional reductions in phosphorus loading or suspended sediments deliveries to Kettle Moraine Lake, although management measures were recommended in the downstream reaches of the Waucousta River.

### ***Little Cedar Lake***

Little Cedar Lake, in the Town of West Bend in Washington County, receives inflow via Cedar Creek from Big Cedar Lake, and, in turn, drains to Cedar Creek, a tributary of the Milwaukee River. The Lake has a surface area of about 259 acres, a maximum depth of 55 feet, and a shoreline development factor of about 1.8. The lands draining to Little Cedar Lake include both urban residential lands and rural, formerly agricultural lands, with residential lands comprising the major portion of the riparian lands to the Lake. The urban residential lands are currently served by onsite sewage disposal systems. The control of urban nonpoint source pollutants is a potential issue of concern and the implementation of drainage basin-scale measures to limit the inflow of runoff to the Lake from the urbanized portion of the drainage basin is likely to benefit this lake. The Little Cedar Lake Protection and Rehabilitation District conducts an aquatic plant management program on the Lake, as well as informational programming aimed at protecting lake water quality.<sup>11</sup> Both urban and rural nonpoint source pollution abatement measures are likely to be warranted in this drainage basin. To this end, a 25 percent reduction in both urban and rural nonpoint source pollutant loads to the Lake was recommended in the initial regional water quality management plan. The Cedar Creek Priority Watershed Plan refined this recommendation as a 30 percent reduction in suspended sediment delivery to Little Cedar Lake.

### ***Long Lake***

Long Lake, in the Town of Osceola in Fond du Lac County, drains to the East Branch of the Milwaukee River. The Lake has a surface area of about 427 acres, a maximum depth of 47 feet, and a shoreline development factor of about 1.8. Long Lake lies largely within the Northern Unit of the State-owned Kettle Moraine State Forest, while portions of the northern shoreline are owned by the Boy Scouts of America and utilized as a camping area. Inflow to the Lake is via Watercress Creek, a state designated trout stream populated by brook trout. Water levels in Long Lake are maintained by an approximately six-foot elevation impoundment, which was constructed in 1860. The inundated areas of the lake shoreline were primarily shoreland wetland prior to the construction of the dam. These areas currently form a shallow shelf surrounding the deeper water portions of the Lake. The control of nonpoint source pollution from onsite sewage disposal systems is an issue of concern, given the relatively dense seasonal camper population. However, the location of the Lake within the Kettle Moraine State Forest provides an opportunity for the implementation of management measures to reduce nutrient inputs to the Lake through the maintenance of the natural landscape. The presence of park staff also provides the opportunity to control litter and macropollutants within the drainage area. The East and West Branches of the Milwaukee River Priority

---

<sup>11</sup>SEWRPC Memorandum Report No. 146, op. cit.

Watershed Plan recommended no additional reduction in phosphorus loading to Long Lake, and a 15 percent reduction in suspended sediments.

#### ***Lucas Lake***

Lucas Lake, in the Town of West Bend in Washington County, is an elongate waterbody on Silver Creek, located at the end of a chain-of-lakes comprised of Silver Lake, Hackbarth Lake, and Lucas Lake. A seven-foot elevation dam controls outflow from this waterbody. Outflow from Lucas Lake drains to Silver Creek, a tributary to the Milwaukee River. The Lake has a surface area of about 73 acres, a maximum depth of 15 feet, and a shoreline development factor of about 2.3. A youth camp occupies a significant portion of the shoreline, which remains in largely rural land use. Control of nonpoint source pollution is not an issue of concern at this time. A 25 percent reduction in urban nonpoint source pollutant loads to the Lake was recommended in the initial regional water quality management plan. The East and West Branches of the Milwaukee River Priority Watershed Plan refined this recommendation as a 10 percent reduction in suspended sediment delivery to Lucas Lake through the application of urban management practices in the urbanized areas of Silver Creek within the West Bend metropolitan area.

#### ***Mauthe Lake***

Mauthe Lake, in the Town of Auburn in Fond du Lac County, is a shallow, wetland-fringed lake located within the Northern Unit of the State-owned Kettle Moraine State Forest. The Lake is a drainage lake, located immediately downstream of Long Lake on the East Branch of the Milwaukee River, and receives inflow from the upstream waterbody. Mauthe Lake has a surface area of about 63 acres, a maximum depth of 22 feet, and a shoreline development factor of about 2.2. A three-foot elevation, fixed crest dam maintains the water levels within Mauthe Lake, and sustains water-based recreation at the State campground and picnic area located on the east shore of the Lake. The control of nonpoint source pollution from onsite sewage disposal systems is not an issue of concern, and the location of the Lake within the Kettle Moraine State Forest provides an opportunity for the implementation of management measures to reduce nutrient inputs to the Lake through the maintenance of the natural landscape. The presence of park staff also provides the opportunity to control litter and macropollutants within the drainage area. The East and West Branches of the Milwaukee River Priority Watershed Plan recommended no additional reductions in phosphorus loading or suspended sediment delivery to Mauthe Lake.

#### ***Mud Lake (Fond du Lac County)***

Mud Lake, in the Town of Osceola in Fond du Lac County, is a drained lake, receiving inflow from Kettle Moraine Lake, located immediately upstream of Mud Lake. Outflow from Mud Lake drains to the Milwaukee River near the Village of Campbellsport. Mud Lake has a surface area of about 56 acres, a maximum depth of 16 feet, and a shoreline development factor of about 1.3. The Lake is shallow and surrounded by a marshy fringe that limits development around its shorelands. Occasional winterkills have been reported from this waterbody. The East and West Branches of the Milwaukee River Priority Watershed Plan recommended no additional reductions in phosphorus loading or suspended sediments deliveries to Mud Lake, although management measures are recommended in the downstream reaches of the Waucousta River.

#### ***Mud Lake (Ozaukee County)***

Mud Lake, in the Town of Saukville in Ozaukee County, is a large, shallow lake surrounded by an extensive floating bog and tamarack forest. The Lake has a surface area of about 245 acres, a maximum depth of four feet, and a shoreline development factor of about 1.4. A 25 percent reduction in nonpoint source pollutant loads to the Lake was recommended in the initial regional water quality management plan. No specific or refined reductions in nonpoint source nutrient loads to the Lake were recommended in the Milwaukee River South Priority Watershed Plan.

#### ***Random Lake***

Random Lake, in the Village of Random Lake in Sheboygan County, is a heavily used recreational lake serving this residential community. The Lake has a surface area of about 213 acres, a maximum depth of 19 feet, and a shoreline development factor of about 1.9. The lands draining to Random Lake include both urban and rural lands, with residential lands comprising the major portion of the riparian lands to the Lake. The control of urban

nonpoint source pollutants is a potential issue of concern and the implementation of drainage basin-scale measures to limit the inflow of runoff to the Lake from the urbanized portion of the drainage basin is likely to benefit this lake. Both urban and rural nonpoint source pollution abatement measures are likely to be warranted in this drainage basin. To this end, the North Branch of the Milwaukee River Priority Watershed Plan recommends a 35 percent reduction in phosphorus load and a 10 percent reduction in suspended solids delivery to the Lake.

### ***Silver Lake***

Silver Lake, in the Town of West Bend in Washington County, forms the headwaters of Silver Creek, which drains to the Milwaukee River through a chain-of-lakes comprised of Silver Lake, Hackbarth Lake, and Lucas Lake. The Lake has a surface area of about 119 acres, a maximum depth of 45 feet, and a shoreline development factor of about 1.7. Silver Lake is surrounded by an established residential community served by public sanitary sewerage service provided by the Silver Lake Sanitary District. Lake management activities are managed by the Silver Lake Protection and Rehabilitation District, which maintains an active program of public informational programming in association with the Silver Lake Improvement Association and Silver Lake Yacht Club. The control of nonpoint source pollution from onsite sewage disposal systems is not an issue of concern. However, management measures to reduce nutrient inputs to the Lake as a result of landscape maintenance practices are indicated. To this end, a 25 percent reduction in both urban and rural nonpoint source pollutant loads to the Lake was recommended in the initial regional water quality management plan. The East and West Branches of the Milwaukee River Priority Watershed Plan refined this recommendation as a 10 percent reduction in suspended sediment delivery to Silver Lake through the application of urban management practices in the urbanized areas of Silver Creek within the West Bend metropolitan area. The implementation of good urban “housekeeping” practices within this watershed was estimated to be adequate achieve this goal.<sup>12</sup>

### ***Smith Lake***

Smith Lake, in the Town of Barton in Washington County, also known as Dickens or Drickens Lake, drains to the Milwaukee River. The Lake is located in a shallow depression in the terminal moraine of the Lake Michigan glacier, and receives surface inflow from the upstream Little Drickens Lake. Smith Lake has a surface area of about 77 acres, a maximum depth of five feet, and a shoreline development factor of about 1.4. While much of the lake shoreline is comprised of marsh, portions of the northern shoreline of the Lake are utilized for residential development which occurred during the 1960s. Much of the remainder of the lake watershed is in agricultural land use. Control of nonpoint source pollution from onsite sewage disposal systems is an issue of concern, as is the control of urban- and agricultural nonpoint source pollutants. No specific reductions in nonpoint source pollutant loads to the Lake were recommended in the initial regional water quality management plan. Likewise, the East and West Branches of the Milwaukee River Priority Watershed Plan recommended no additional or refined reductions in phosphorus loading or suspended sediment delivery to Smith Lake.

### ***Spring Lake***

Spring Lake, in the Town of Fredonia in Ozaukee County, is a seepage lake, located within the terminal moraine of the Lake Michigan glacier. The Lake has a surface area of about 66 acres, a maximum depth of 20 feet, and a shoreline development factor of about 1.5. A 25 percent reduction in nonpoint source pollutant loads to the Lake was recommended in the regional water quality management plan. The North Branch of the Milwaukee River Priority Watershed Plan refined this recommendation as a 10 percent reduction in phosphorus load and suspended solids delivery.

### ***Lake Twelve***

Lake Twelve, in the Town of Farmington in Washington County, is a shallow depression in the ground moraine of the Lake Michigan glacier. The Lake is spring fed, with a marshy seepage outflow to a small stream tributary to the North Branch of the Milwaukee River. Lake Twelve has a surface area of 56 acres, a maximum depth of 20 feet, and a shoreline development factor of about 1.0. The lake shoreland is occupied in large part by a church camp located on the southern shore of the Lake. Much of the north shore of the Lake is occupied by woodlands

---

<sup>12</sup>SEWRPC Memorandum Report No. 123, op. cit.

and wetlands. Runoff from developed lands surrounding the Lake is a limited concern. The initial regional water quality management plan recommended a 25 percent reduction in urban and a 75 percent reduction in rural nonpoint source pollutant loads to the Lake. The North Branch of the Milwaukee River Priority Watershed Plan refined this recommendation to require a 20 percent reduction in phosphorus and bacteria loads to be effected by reducing barnyard runoff and winter-spreading of manure and a 20 percent reduction in suspended solids by reducing cropland erosion.

### ***Wallace Lake***

Wallace Lake, in the Town of Barton in Washington County, receives inflow from the upstream Lenwood Lake. However, the Lake, which is a small, "kettle" lake in the terminal moraine of the Lake Michigan glacier receives the majority of its inflow from groundwater sources. Outflow from the Lake drains through a small tributary to the Milwaukee River. Wallace Lake has a surface area of about 50 acres, a maximum depth of 35 feet, and a shoreline development factor of about 1.7. An urban-density residential community forms the shorelands of Wallace Lake. These residences are served by public sanitary sewerage services provided by the Wallace Lake Sanitary District, which also performs lake-oriented services such as aquatic plant management. The control of urban nonpoint source pollutants is a potential issue of concern. To this end, a 25 percent reduction in urban nonpoint source pollutant loads to the Lake was recommended in the initial regional water quality management plan. The North Branch of the Milwaukee River Priority Watershed Plan refined this recommendation to require a 20 percent reduction in phosphorus load and suspended solids.

### **Minor Lakes**

#### ***Milwaukee County Ponds and Lagoons***

The Milwaukee County ponds and lagoons collectively include 68 small waterbodies primarily located within the Milwaukee County Park System that range in surface area from the approximately 0.1 acre dry basins in Bender Park to the 19-acre Grobschmidt Park Pond, also known as Mud Lake. This waterbody is also the deepest of the ponds and lagoons, having a maximum depth of 17 feet. The 1.2-acre Root River Parkway Pond also has a maximum depth of 17 feet. The ponds and lagoons are the point of contact with inland lake ecosystems for many Milwaukee County residents and their visitors, and are heavily used recreational resources, supporting a heavily utilized fishery. In general, the initial regional water quality management plan recommended a reduction in nonpoint source contaminants of between 25 and 50 percent within Milwaukee County, with the 50 percent level of reductions in nonpoint source loadings applying to the southern portions of the County, within the Oak Creek and Root River watersheds, and the 25 percent reductions applying to the Menomonee and Milwaukee River watersheds. These reductions in the case of the ponds and lagoons are proposed to be achieved through control of shoreline erosion and stabilization of shorelines, as set forth in the pond and lagoon management plan and through implementation of the recommended urban nonpoint source pollution measures set forth in this water quality plan update.<sup>13</sup>

#### ***Upper and Lower Kelly Lakes***

The Kelly Lakes have a collective surface area of about 15 acres: Upper Kelly Lake has a surface area of 12 acres, a maximum depth of 31 feet, and a shoreline development factor of about 1.1; Lower Kelly Lake has a surface area of about 3 acres, a maximum depth of 36 feet, and a shoreline development factor of about 1.1. Lower Kelly Lake drains through a wetland complex into Upper Kelly Lake, which is a drainage lake situated on an unnamed tributary stream of the Root River. The nonpoint source pollution reduction goals for the Lakes have been set at a 50 percent reduction in loadings in both the Root River Priority Watershed Plan and the initial regional water quality management plan.<sup>14</sup> The implementation of a stream and wetland restoration program at the mouth of the

unnamed tributary discharging into Upper Kelly Lake, documented in the refined lake protection plan,<sup>15</sup> together with the application of good “housekeeping” practices in the drainage area, is estimated to accomplish a cumulative nonpoint source pollution load reduction of about 50 percent to Upper Kelly Lake.

## **EFFECTIVENESS OF PLAN IMPLEMENTATION AND RECOMMENDATIONS FOR FUTURE ACTION**

### **Setting Goals**

The initial regional water quality management plan set forth specific watershed-based management measures recommended for implementation in the areas directly tributary to the major lakes within the Southeastern Wisconsin Region. In several cases, these recommendations were refined through the priority watershed nonpoint source pollution abatement planning process. In many of those refined plans, the nonpoint source pollution reduction goals were slightly higher or lower than those established during the initial regional water quality management planning program. The pollutant reductions recommended under the priority watershed study generally applied to total suspended solids and, in some instances, phosphorus and/or bacteria. It is recommended that 1) the priority watershed pollutant reductions as enumerated herein be achieved for the applicable pollutants and 2) the reductions recommended under the initial regional water quality management plan be achieved for other nonpoint source pollutants.

The specific point and nonpoint source pollution reduction goals for any given waterbody should be refined through a detailed lake-focused planning program. As noted above, various levels of plans have been prepared, among others, for Big Cedar Lake, Little Cedar Lake, and Silver Lake within the greater Milwaukee watersheds. These plans have been prepared at the request of the public inland lake protection and rehabilitation districts serving these lake-oriented communities. Financial assistance in preparing these plans can be accessed through the Chapter NR 190 Lake Management Planning Grant program. Plans can be prepared by a variety of contractors, including SEWRPC and private sector consulting firms. Some firms are listed in *The Lake List*, compiled by the University of Wisconsin-Extension. The costs of these plans, and nature of these plans—whether planning or engineering design, will depend upon site-specific conditions and requirements.

It is recommended that lake plans be prepared for the remaining major lakes in the study area. It is also recommended that Milwaukee County pursue implementation of the recommendations in its 2005 pond and lagoon management plan.

### **Lake Monitoring**

Few long-term data sets exist for the major lakes within the greater Milwaukee watersheds. Of the available data sets, the data on Big Cedar Lake in Washington County provide the best available index of the success of the initial regional water quality management plan. These data, summarized in SEWRPC MR No. 137,<sup>16</sup> and updated in SEWRPC TR No. 39, clearly demonstrate the effectiveness of the recommended lake management actions set forth in the initial regional water quality management plan for lakes within the greater Milwaukee watersheds.

Establishment, of long-term-trend lake monitoring programs for the major lakes of the study area is recommended. These programs could be conducted by an appropriate State agency or by local government units, such as public inland lake protection and rehabilitation districts, with some of the monitoring program costs being offset through grant programs, such as the Chapter NR 190 lake management planning grant program. The estimated cost of a trophic state monitoring program, that would acquire data on phosphorus and chlorophyll

concentrations and Secchi-disc transparency, ranges from \$1,000 to \$6,000 per year, depending upon frequency of sampling, the entity collecting the samples, and water quality monitoring program selected.<sup>17</sup>

### **Informational Programming**

Figure Q-1 shows the trends observed in the Wisconsin Trophic State Index (WTSI) values calculated for Big Cedar Lake between 1971 and 2005. Given that a lower WTSI indicates better water quality for the period from 1980 to 1995, this figure shows, in part, the effectiveness of implementing nonpoint source pollution abatement measures recommended in the original regional water quality management plan. This figure also reflects the impact of changing land use conditions within the area tributary to Big Cedar Lake during this period, as well as the results of the active informational and educational campaign conducted by the Big Cedar Lake Protection and Rehabilitation District. The latter included the distributing informational materials on residential good “housekeeping” practices, promoting and selling phosphorus-free fertilizer, and conducting events aimed at raising public awareness of lake issues. With the exception of the bulk purchase of phosphorus-free fertilizer, most of these efforts have involved little or no additional cost to the District. Many informational materials are available without charge or at a nominal charge from various agencies and organizations, such as the WDNR and University of Wisconsin-Extension. Consequently, implementation of a community-based informational program is recommended.

Formal, school-based curricula are available to complement public informational programming. Programs such as Project WET (Water Education for Teachers) and Adopt-A-Lake have been utilized by school districts to promote lake awareness and environmental awareness in general. Some lake management organizations have supported teacher training, and even the implementation of these curricula, while other lake organizations have organized and conducted “pontoon classrooms” that put young people “on the water” where they can be instructed on aquatic ecology and related topics by WDNR staff, community-based consultants, and others who are engaged in the practice of lake management. Where the opportunities exist, the conduct of these types of educational programs is recommended. Because they are frequently organized and staffed by volunteers or agency staff, these programs can have a relatively low cost.

### **Changing Land Uses**

Superimposed upon the actions of the Big Cedar Lake Protection and Rehabilitation District was the trend toward urban residential land uses within the drainage area and, indeed, within the Town of West Bend as a whole, that resulted in the diminution of agricultural sources of contaminants to the Lake with concomitant water quality benefit. Subsequent to the data shown in Figure Q-1, data reported in SEWRPC TR No. 39 suggested that there was a period during the late 1990s and early 2000s during which water quality, as measured by Secchi disc transparency, as well as in terms of total phosphorus and chlorophyll concentrations, deteriorated, possibly in response to the extension of intensive residential and commercial land uses westward from the City of West Bend along the STH 33 corridor. Similar trends and tendencies can be seen for most of the lakes for which data are

---

<sup>17</sup>*Sampling and analysis services provided by the Wisconsin District of the U.S. Geological Survey offer a comprehensive program of sample collection, analysis and reporting, with data being published annually in the U.S. Geological Survey Open-File Report Series, Water-Quality and Lake-Stage Data for Wisconsin Lakes; the WDNR Self-Help Monitoring program offers a standard, Secchi-disc-based citizen water clarity monitoring package in which volunteers can enroll at no cost and an expanded trophic state index monitoring program in which volunteers who have successfully completed a year in the Secchi-disc-based program can enroll; and the University of Wisconsin-Stevens Point, Water and Environmental Analysis Laboratory (WEAL) lake monitoring programs offer both a spring and fall overturn package and a summer season package in which citizens collect samples for analysis by the University. These programs span the range of costs, and provide quantitative data on lake ecosystem health that are essential to assessing the degree to which both point and nonpoint source pollution abatement programs benefit the lakes of the greater Milwaukee watersheds. The selection of specific programs has been the decision of the local communities, and specifically of the public inland lake protection and rehabilitation districts where such special purpose units of government exist.*

Figure Q-1

TROPHIC STATE INDEX FOR THE NORTHERN AND SOUTHERN BASIN OF BIG CEDAR LAKE: 1990-2005

Source: Wisconsin Department of Natural Resources and SEWRPC.

available, as documented in the Wisconsin Trophic State Index figures in Chapter VII of SEWRPC TR No. 39, although it is more clearly seen in the deeper lakes (Big Cedar, Little Cedar, Long, and Random), as shown in Chapter VII of SEWRPC TR No. 39. This millennium maximum can be clearly seen in the Secchi disc-based Wisconsin Trophic State Index (WTSI) values for Random Lake and Little Cedar Lake, and in the total phosphorus concentration-based WTSI values for Big Cedar Lake, Little Cedar Lake, and Random Lake. The data set for Long Lake is less clear, as data were not collected after the 2001 hydrologic year. With respect to the shallow lakes (Ellen, Forest, Green, and Wallace), as shown in Chapter VII of SEWRPC TR No. 39, Secchi disc-based WTSI values for Wallace Lake suggest a millennium peak. While the precise reasons for these changes in lake trophic state may vary among the lakes for which data are available, some measure of water quality impairment and/or improvement can be ascribed to changing land use conditions. Typically, within the Southeastern Wisconsin Region, these changes reflect the conversion of agricultural lands to urban, primarily residential, land uses. Such changes generally reduce the mass of nutrients being placed upon the land surface, reduce the mass of sediment likely to be transported off the land surface by erosion, and modify the composition of the available contaminants by introducing additional pollutants such as heavy metals into the environment. For this reason, it is recommended that land use changes be reviewed and evaluated for potential lake-related impacts at the time planning and zoning decisions are made.

### **Managing Stormwater and Runoff**

In addition to their informational efforts, the Big Cedar Lake Protection and Rehabilitation District, in partnership with other governmental and nongovernmental organizations, such as the Cedar Lakes Foundation Inc., purchased critical properties within the area tributary to the Lake and installed stormwater management practices that reduced the quantities of nonpoint source pollutants entering the Lake. These actions, and the subsequent recovery of water quality within Big Cedar Lake, highlight the need for ongoing remedial actions, especially during periods of land disturbance. Consequently, the ongoing application of construction site erosion controls, and the implementation and maintenance of onsite or community stormwater management practices following construction, is recommended. Costs are proportional to surface area served, and the technology selected. Generally, implementation of stormwater management practices is subject to detailed engineering design. These community-based actions support and complement state and local stormwater management requirements, such as those established pursuant to the standards set forth in Chapter NR 151 of the *Wisconsin Administrative Code*. In this regard, the inclusion of specific stormwater management requirements within local zoning codes is recommended, where such requirements do not currently exist. Likewise, it is recommended that critical parcels be identified for possible acquisition by both governmental and nongovernmental entities for purposes of environmental protection. For example, certain parcels of local, regional, or statewide importance are currently identified in the regional critical species habitat and natural areas protection and management plan, and preservation of those parcels is recommended in the land use element of the recommended plan presented in Chapter X of this report. Property acquisition is site-specific, and in the Southeastern Wisconsin Region, generally involves significant costs, which can, in certain situations, be offset by soliciting support from available grant programs, such as the Chapter NR 50/51 Stewardship program, Chapter NR 191 Lake Protection Grant program, or Chapter NR 195 River Planning and Protection Grant program.

### **ANCILLARY LAKE MANAGEMENT PLAN RECOMMENDATIONS**

In addition to the foregoing lake and watershed management measures set forth in the adopted management plans, and the conduct of recommended local level lake management planning programs, the county land and water resource management plans recommend that lake associations and public inland lake protection and rehabilitation districts, where they exist, continue to participate in the WDNR Self-Help Monitoring Program or an equivalent program so as to further develop the knowledge base on lake water quality. Lakes not currently participating in these programs are encouraged to do so. In addition, it is recommended that the lake communities, through the appropriate local authorities, whether municipal governments or lake organizations, develop and deliver informational and educational programs involving both the community and local schools. Educational programs for schools include the Project WET, or Water Education Training for educators, and Adopt-A-Lake programs run through the University of Wisconsin-Extension. In addition, municipalities and lake organizations serving these lake communities are encouraged to make available appropriate lawn and garden care educational materials,

available through the University of Wisconsin-Extension, and to hold periodic seminars and other programs for homeowners and landscape contractors, among others, to present environmentally-friendly design options especially (but not exclusively) for shoreland areas. These efforts will complement other lake- and watershed-based interventions and directly contribute to the implementation of lake management measures within the greater Milwaukee watersheds.

## **CONCLUDING REMARKS**

Lakes are an integral part of the southeastern Wisconsin landscape. They form a focus for recreational activities and often form the center of lake-oriented residential communities. As the watersheds within which the lakes are located change in response to changing human demands, the stressors placed upon these waterbodies change. Currently, many of these stressors have shifted from a primarily rural, agricultural to urban, largely residential basis, resulting in a diminution of some contaminant loads such as sediments and nutrients and the introduction of emerging contaminants such as heavy metals. Management of these changes requires awareness of the likely issues facing lake-oriented communities, as well as awareness-building among the communities to promote lake-friendly practices. More specific interventions for lake protection and rehabilitation require site-specific planning, which will refine the recommendations set forth herein with respect to these community level and watershedwide concerns.

Appendix R Footnotes

<sup>a</sup>These costs were developed at a systems planning level, and they are provided to indicate to each municipality or unit of government the possible public sector cost to implement the recommended plan. The costs have a range of accuracy of +50 percent to -30 percent. Second level planning, such as facilities and stormwater management planning, would be needed to develop refined costs specific to each municipality or unit of government. The presentation of these costs does not obligate the municipality to make the indicated expenditures.

<sup>b</sup>The totals for each of the 28 MMSD member communities and Milwaukee County do not include the community's portion of the estimated \$400 million for local management of sanitary sewer infiltration and inflow. That total amount is included in the cost assigned to the MMSD for implementation of the 2020 facilities plan.

<sup>c</sup>See Table X-2 in Chapter X of this report for a complete listing of recommended plan subelements. Subelements or components of subelements for which no costs are assigned are not included in this table.

<sup>d</sup>Costs represent 2007 conditions. 2007 Engineering New-Record Construction Cost Index = 10,000. In general, where not qualified by another footnote, double dashes indicate that either it is not appropriate to assign a cost to a component, a cost is already incurred under another program or plan, or it is not possible to reasonably estimate the cost of a component because it is affected by future actions whose scope cannot be determined at this time.

<sup>e</sup>The costs associated with implementation of the components of the regional land use plan that are incorporated in this plan are determined by many different, variable factors, such as fluctuations in the real estate market and changing Federal and State programs, making realistic estimation of those costs highly speculative. Thus, the overall costs of implementing a regional land use plan element are traditionally not estimated.

<sup>f</sup>Cost only reflects program to detect locations of illicit discharges. Costs of elimination are case specific and therefore not included here.

<sup>g</sup>A detailed breakdown of the MMSD 2020 Facilities Plan components and associated costs is presented in Tables X-3 and X-3a. The costs presented here reflect only those shown in Table X-3 which represent proposed new facilities, programs, operational improvements, and policies, including an estimated \$400 million for management of sanitary sewer infiltration and inflow by the MMSD member and contract communities and Milwaukee County. This total capital cost is \$152 million less than the total in Table X-3, and the total annual operation and maintenance cost is \$1.7 million less than the amount in Table X-3. Those differences reflect the regional water quality management plan update recommendation that the addition of physical-chemical treatment at the MMSD South Shore wastewater treatment plant not be implemented, pending 1) further development by MMSD of the variable volume reserved for sanitary sewer inflow operating strategy for the Inline Storage System, 2) the results of capacity analyses for the Jones Island and South Shore plants, 3) determination of actual population and land use changes, and 4) determination of the success of the wet weather peak flow management program undertaken by MMSD and the communities that it serves.

<sup>h</sup>Includes \$121,720,000 for implementation of the urban nonpoint source pollution abatement standards of Chapter NR 151 of the Wisconsin Administrative Code. That amount is not included in Table X-2.

<sup>i</sup>Includes \$8,625,000 for implementation of the urban nonpoint source pollution abatement standards of Chapter NR 151 of the Wisconsin Administrative Code. That amount is not included in Table X-2.

## **Appendix S**

# **INCENTIVES FOR ADDRESSING AGRICULTURAL NONPOINT POLLUTION SOURCES IN THE CONTEXT OF A WATERSHED-BASED PERMIT**

### **INTRODUCTION**

During the process of developing the implementation approach for the regional water quality management plan update there has been considerable discussion of mechanisms for addressing abatement of agricultural nonpoint pollution sources. For such sources to be effectively controlled, financial incentives for farmers to implement the measures called for under the plan should be considered. Additionally, certain recommended measures would be implemented through the established land and water resource management plans that are in place for each county in the study area. The following are possible financial incentives that could be provided:

- The implementing entity could provide additional payments to landowners to promote enrollment of land in the Conservation Reserve Enhancement Program (CREP), or similar conservation programs. Enrollment in such programs would further the recommended plan goals regarding riparian buffer establishment and prairie and wetland restoration. The additional payments could be made to make up the difference in the payments under the CREP program and the farmer's cost to remove the enrolled land from production.
- The implementing entity could make grant funding available to enable greater implementation of agricultural nonpoint source pollution control components of the Chapter NR 151 standards.
- Water quality trading which is a voluntary, market-based approach under which an entity which would incur high costs to control a pollutant purchases pollutant reductions, or "credits," from a different entity that has lower costs to produce an environmentally equivalent, or better, pollution reduction.

### **SPECIFIC ISSUES RELATED TO WATER QUALITY TRADING**

#### **Background**

According to the USEPA, favorable conditions for successful implementation of a water quality trading system include:<sup>1</sup>

---

<sup>1</sup><http://www.epa.gov/owow/watershed/trading.htm>.

- The existence of a “driver” that motivates facilities to reduce loads of a pollutant, such as a water quality-based requirement in a NPDES permit or establishment of a TMDL (see Chapter VI of this report),
- Pollution sources in a watershed that have significantly different costs to control the pollutant of concern,
- The necessary levels of pollutant reduction are not so large that loads from all sources in a watershed must be reduced as much as possible to attain the total reduction needed, indicating a lack of surplus reductions to trade, and
- State regulators and watershed stakeholders are open to applying a water quality trading approach.

Three approaches to water quality trading may be applicable to implementation of the regional water quality management plan update: 1) trading of point source controls on discharges from sewerage systems, including wastewater treatment plants, for controls on upstream nonpoint sources, such as agricultural runoff; 2) trading of controls on urban stormwater among the municipal members of a group that has obtained a WPDES stormwater discharge permit;<sup>2,3</sup> and 3) trading of controls on urban stormwater for controls on upstream nonpoint sources, such as agricultural runoff.

The USEPA water quality trading policy also specifically supports water quality trades in instances where such trades achieve “greater environmental benefits than ... under existing regulatory programs ..., such as the creation and restoration of wetlands, floodplains and wildlife and/or waterfowl habitat.”<sup>4</sup> Water quality trading within the context of the recommendations of the regional water quality management plan update would likely provide such greater environmental benefits through riparian buffer establishment, wetland and prairie restoration, and instream habitat improvement.

The USEPA supports trading of nutrients, such as nitrogen and phosphorus and sediment (including cross-pollutant trading of nutrient reductions to offset downstream oxygen-related impacts). The USEPA also recognizes that trading could be accomplished for other pollutants such as heavy metals and thermal loads, but it categorizes those types of trades as being riskier. When nonpoint source pollution reductions are traded for point source loads, a factor of safety is generally applied to the nonpoint source reduction because of the inherent uncertainties in estimating the effectiveness of best management practices in reducing nonpoint source loads and the inability to adequately measure nonpoint source loads and load reductions at a large scale. The USDA Conservation Effects Assessment Program has been initiated to develop standardized ways to estimate the environmental value of various agricultural conservation systems.<sup>5</sup>

Water quality trades may occur directly between trading partners, through the intercession of a broker; through aggregators who accumulate pollution reduction credits from several entities that can then be sold in bulk to

---

<sup>2</sup>Stormwater discharge permit group members are listed in Chapter II of this report.

<sup>3</sup>In water quality trading cases, application of the principle of environmental equivalence interjects the requirement that the lower cost pollution reduction be obtained from a source that is located upstream of the source for which the credits are to be purchased.

<sup>4</sup>USEPA Office of Water Quality Trading Policy, Final Water Quality Trading Policy, January 13, 2003.

<sup>5</sup>Marc Ribaud, Robert Johansson, and Carol Jones, Environmental Credit Trading: Can Farming Benefit?, U.S. Department of Agriculture, February 2006. Available at: <http://www.usda.gov/AmberWaves/February06/Features/featureupdate.htm>.

entities seeking to purchase credits; and through the facilitation of a single, central exchange that purchases and sells credits.<sup>6</sup>

In situations where a farmer is participating in the USDA cost-share funded conservation programs (e.g., the Conservation Reserve or Conservation Reserve Enhancement Programs), it may not be possible to trade credits from a cost-shared practice.<sup>7</sup>

#### **Water Quality Trading in the Context of the Recommended Plan and a Watershed-Based Permit**

The regional water quality management plan update, which is based on a watershedwide water quality model that is applied to establish specific recommendations for improving water quality, could be a key factor in determining the pollution reduction goals that are necessary for implementing water quality trading.

At the most fundamental level, the feasibility of a water quality trading approach is dependent on the availability of excess water quality credits, i.e., additional pollution reductions from a given source beyond the level of reduction needed to meet specified water quality goals. In the case of the recommended regional water quality management plan update, it has been demonstrated that improvements in water quality that are significant enough to achieve compliance with water quality standards in noncompliant stream reaches would not be expected from additional, generally costly controls on point sources such as wastewater treatment plant discharges, combined and separate sanitary sewer overflows, and industrial discharges, but that significant water quality improvements could be attained through implementation of less costly controls on urban and rural nonpoint source pollution. However, as indicated in Chapter X of this report, for certain stream reaches and pollutants, even with complete implementation of the recommended water quality plan, compliance with the applicable water use objectives and supporting water quality standards and criteria would not be expected. Nonetheless, implementation of the recommended plan can be seen as a significant additional step toward attainment of fishable and swimmable conditions in the streams and lakes of the study area as called for under the Federal Clean Water Act. If a watershed-based permit were designed to achieve water quality improvement consistent with implementation of the recommended water quality management plan update, the applicability of water quality credit trading and the degree to which such trading could be applied would be greatly dependent on how baseline conditions for nonpoint sources, particularly agricultural sources, were established. In the future, when total maximum daily loads of pollutants of concern are developed as required by the USEPA, the ability to trade water quality credits would have to be reevaluated.

# MODEL RESOLUTION FOR ENDORSEMENT OF THE REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE FOR THE GREATER MILWAUKEE WATERSHEDS

WHEREAS, the Southeastern Wisconsin Regional Planning Commission, which was duly created by the Governor of the State of Wisconsin in accordance with Section 66.0309(2) of the *Wisconsin Statutes* on the 8th day of August 1960, upon petition of the Counties of Kenosha, Milwaukee, Ozaukee, Racine, Walworth, Washington, and Waukesha, has the function and duty of making and adopting a master plan for the physical development of the Region; and

WHEREAS, the Governor of the State of Wisconsin has designated the seven-county Southeastern Wisconsin Region as an areawide water quality management planning area and the Southeastern Wisconsin Regional Planning Commission as the official water quality management planning agency for that area, all in accordance with the procedural requirements set forth in Section 208 of the Federal Water Pollution Control Act; and

WHEREAS, the Southeastern Wisconsin Regional Planning Commission, pursuant to its function and duty as a regional planning agency and its designation as a water quality management planning agency, has prepared and adopted at its meeting held on the \_\_\_\_ day of \_\_\_\_\_ 200\_, an update to the areawide water quality management plan set forth in a report entitled, SEWRPC Planning Report No. 50, *A Regional Water Quality Management Plan Update for the Greater Milwaukee Watersheds*, published in \_\_\_\_\_ 200\_; and

WHEREAS, the Commission has transmitted certified copies of its resolution adopting the regional water quality management plan update for the greater Milwaukee watersheds, together with the aforementioned SEWRPC Planning Report No. 50, to the local units of government concerned and to the appropriate State and Federal agencies; and

WHEREAS, the (name of local governing body) has supported, participated in the financing of, and generally concurred in the regional planning programs undertaken by the Southeastern Wisconsin Regional Planning Commission, and believes that the regional water quality management plan update prepared by the Commission is a sound and valuable guide to water quality management in the development of not only the Region but also the local community, and that the adoption of such plan by the (name of local governing body) will assure a common understanding by the units and agencies of government concerned and enable these units and agencies of government to program the necessary plan implementation work.

NOW, THEREFORE, BE IT RESOLVED that, pursuant to Section 66.0309(12) of the *Wisconsin Statutes*, the (Name of Local Governing Body) on the \_\_\_\_ day of \_\_\_\_, 200\_, hereby endorses the regional water quality management plan update for the greater Milwaukee watersheds previously adopted by the Commission as set forth in SEWRPC Planning Report No. 50 as a guide for regional and community development.

BE IT FURTHER HEREBY RESOLVED that the \_\_\_\_\_ clerk transmit a certified copy of this resolution to the Southeastern Wisconsin Regional Planning Commission and to the Secretary of the Wisconsin Department of Natural Resources.

---

(President, Mayor, or Chairman  
of the Local Governing Body)

ATTESTATION:

|-----------------------------------------------------------|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|----------------------|
| <b>Educational and Other Watershed Improvement Grants</b> |                                        |                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                          |                      |
| USEPA                                                     | Environmental Education Grants Program | Local or State education agencies, colleges, and nonprofit organizations, State environmental agencies, and noncommercial education broadcasting agencies | <ol style="list-style-type: none"> <li>1. Improving environmental education teaching skills</li> <li>2. Educating teachers, students, or the public about human health problems</li> <li>3. Building capacity for environmental education programs</li> <li>4. Education communities</li> <li>5. Educating the public through print, broadcast, or other media</li> </ol> | \$2 million available nationally <sup>d</sup> ; locally, grants are for \$5,000; \$5000 to \$25,000; and up to \$100,000 | Mid-November         |

NOTE: The Catalog of Federal Domestic Assistance programs can be accessed at: <http://12.46.245.173/cfda/cfda.html>. Additional information on grants can be accessed through the U.S. Environmental Protection Agency at: <http://cfpub.epa.gov/fedfund/> and the University of Wisconsin-Madison Libraries Grants Information Collection at: <http://grants.library.wisc.edu>.

<sup>a</sup>Some of the programs described in this table may not be available under all envisioned conditions for a variety of reasons, including local eligibility requirements or lack of funds in Federal and/or State budgets at a given time.

<sup>b</sup>In kind services are allowed as a part of the local cost-share assistance.

<sup>c</sup>Two types of sign-up are available for CRP: continuous CRP, which has no timeline and is used for small sensitive tracts of land and regular CRP, which has an annual sign up application period and is used for large tracts of land.

<sup>d</sup>Available on an annual basis.

<sup>e</sup>The Fish and Wildlife Service receives support funding from the National Fish and Wildlife Foundation and other private sources to help fund this program.

<sup>f</sup>Must apply through an intermediary organization which includes the National Association of Counties, the National Association of Service and Conservation Corps, the National Fish and Wildlife Foundation, and the Wildlife Habitat Council.

<sup>g</sup>The Wisconsin Department of Natural Resources utilizes USDA Forest Service funding for the Stewardship Incentives Program.

<sup>h</sup>Cost-sharable practices must be part of implementation of a Forest Stewardship Plan prepared by a forester.

<sup>i</sup>EQIP provides minimal funding in Southeastern Wisconsin.

<sup>j</sup>The USEPA provides grant funding to the private nonprofit organization River Network to disburse funding. Applications must be made through River Network.

<sup>k</sup>The Lake Classification Grant Program is a subgrant program of the Lake Protection Grant Program.

**PUBLIC HEARING INFORMATION AND  
WRITTEN COMMENTS ON THE PLAN**

PUBLIC INFORMATION MEETINGS AND HEARINGS  
SCHEDULED ON REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE FOR THE  
GREATER MILWAUKEE WATERSHEDS

Citizens are invited to public information meetings and hearings related to the protection and improvement of water quality in a major portion of southeastern Wisconsin. These sessions will provide opportunities to learn more about, and to comment on, the findings and recommendations documented in Southeastern Wisconsin Regional Planning Commission (SEWRPC) Planning Report No. 50, *A Regional Water Quality Management Plan Update for the Greater Milwaukee Watersheds*. The plan includes recommendations related to land use, surface water quality, and groundwater quality in the Kinnickinnic, Menomonee, Milwaukee, and Root River watersheds; the Oak Creek watershed, and the direct drainage area to Lake Michigan. These watersheds are roughly comprised of areas draining toward Lake Michigan from extreme northeastern Dodge County, southeastern Fond du Lac County, southwestern Sheboygan County, eastern Washington County, all of Ozaukee County except the northeastern portion, extreme eastern Waukesha County, all of Milwaukee County, eastern Racine County, and a small portion of the Town of Paris in Kenosha County. The study area also includes the nearshore Lake Michigan area from the Village of Fox Point to the Village of Wind Point. Copies of the report chapters, including the recommended plan chapter, are now available for review on the SEWRPC web site at <http://www.sewrpc.org/waterqualityplan/chapters.asp>.

The plan was prepared by SEWRPC, in partnership with the Milwaukee Metropolitan Sewerage District (MMSD) under the "Water Quality Initiative," and in cooperation with the Wisconsin Department of Natural Resources (WDNR) and the U.S. Geological Survey (USGS). The plan was developed in close coordination with the MMSD 2020 Facilities Plan. Preparation of the plan was guided by a Technical Advisory Committee composed of representatives of county and municipal government, special-purpose units of government, MMSD, WDNR, USGS, the U.S. Environmental Protection Agency, academic institutions, and environmental and conservation organizations. In addition, the regional water quality management plan and MMSD Facilities Plan were presented and discussed at periodic meetings of a joint Citizens Advisory Council formed specifically to provide input on the two plans and at meetings of watershed officials, consisting of the elected and appointed representatives from the counties, cities, villages, and towns in the study area.

The following 4:30-7:00 p.m. sessions will be held during October 2007:

October 15 at Gateway Technical College, Racine Campus, Racine Building, 901 Pershing Drive, Parking Lot D, Great Lakes Room (#110)

October 16 at the Downtown Transit Center, Harbor Lights Room (upper floor), 909 E. Michigan Street, Milwaukee

October 23 at Riveredge Nature Center, 4458 W. Hawthorne Drive, Newburg, WI, 53060, located a mile north of STH 33 on CTH Y, northeast of Newburg

Each session will begin with a meeting in "open house" format from 4:30-5:30 p.m., which will provide an opportunity to meet one-on-one or in small groups with the Commission staff to receive information, ask questions, and provide comment. A presentation will be made by the Commission staff at 5:30 p.m., followed by a public hearing providing a forum for public comment in "town hall" format from approximately 6:00 p.m. to 7:00 p.m.

Persons with special needs are asked to contact Gary K. Korb at (262) 547-6721 a minimum of 72 hours in advance of the public session date so that appropriate arrangements can be made. Affected may be site access and/or mobility, materials review or interpretation, or active participation, including the submission of comments.

In addition to providing comments at the public meetings and hearings, written comments may also be submitted. Written comments should be received no later than Wednesday, October 24, 2007. To obtain a paper copy of the recommended plan chapter, to ask questions, or to submit written comments on the Regional Water Quality Management Plan Update, please contact:

## TRANSCRIPT OF PROCEEDINGS

(Mr. Schmidt announced the following two  
upcoming meetings, Oct. 16, 2007 and October 23,  
2007.)

MR. SCHMIDT: We'll go right into the  
public comment portion of the meeting. If you  
have a public comment, I would ask that -- Are  
there microphones out there at all?

MR. HAHN: There's one up there on  
the -- in the middle --

MR. SCHMIDT: I would ask that you would  
state your name and address, and if you have any  
affiliation to a -- Also, there's cards you should  
sign in. We need that for the public record.

But if you have any affiliation with a  
municipality, a county organization, city,  
village, town, whatever, or DNR, other private or  
public organization, please state that as well and  
indicate that on the form.

And also, if you do not wish to publicly  
comment but would like to send in a comment, there  
are forms available for that. And we'd ask that  
you turn those in by the 24th of October.

So would anybody like to comment?  
Nobody has any general comments? If you have

BROWN & JONES REPORTING, INC.  
414-224-9533

SEWRPC HEARING, 10/15/2007

4

specific questions relating to any of the topics,  
you can contact Mike at the Regional Planning  
Commission, or Joe, Tom, and Ron and Matt. Gary  
will point you in the right direction as well.  
They're very helpful and will try and explain in  
detail any clarification.

No comments or concerns? If you're not  
sure, please take along one of the forms that you  
could send in if you have it. Yes, sir?

MR. MADSEN: A question, not a comment.  
How many places within the study area here are  
collecting water samples from storm water  
discharges and then giving you information on  
those things?

MR. HAHN: Wally, could you just give  
your name and address, please?

MR. MADSEN: Oh, I'm Wally Madsen, and I  
live in the Town of Raymond. Business is in the  
City of Racine. I'm an engineer, sort of it,  
semiretired.

MR. HAHN: Well, Joe or Tom, you can  
chime in on this, but we did not -- we were not  
looking so much at outfall information in terms of  
storm sewer outfalls. We were monitoring data  
collected with primarily in-stream data at various

BROWN & JONES REPORTING, INC.  
414-224-9533

locations.

And I think we certainly -- we certainly took into account whatever data we knew of in terms of, for example, the issues that have come up as far as the fecal coliform bacteria counts coming out of the storm sewer outflow, and that certainly informed the decisions we made in terms of crafting the recommended plan.

But we weren't really looking at that kind of monitored data as closely as we were looking at the in-stream data. We did look at point sources at the outfall in terms of general characterization of the quantities of --

MR. MADSEN: One --

MR. HAHN: -- discharge.

MR. MADSEN: -- of the reasons I ask the question, Mike, was because we're doing some monitoring on the Village of Wind Point storm sewer discharges, and we have -- the City of Racine is collecting the samples and doing the chemical analysis of the stuff. And we are looking for fecal coliform, looking for phosphorus, and possibly we'll get into the nitrogen thing, too.

And they're trying to implement then

BROWN & JONES REPORTING, INC.  
414-224-9533

some programs within the -- not mandatory, but a program that you would follow using the no-phosphorus type fertilizers and that type of stuff. And Wind Point has been kind of blessed or -- or cursed with some of the smells that come off of the decaying vegetation on the shoreline of Lake Michigan.

MR. SLAWSKI: I would like to add something. As -- I'm Tom Slawski with Southeastern Wisconsin Regional Planning Commission staff.

When we were setting up or beginning the process of modeling and looking at loads and trying to come up with this, particularly looking at combined sewer overflow and sanitary sewer overflow numbers for input to loading to the model, we -- MMSD did have some information on first and second flush, pre and post implementation for the in-line storage system.

So we meticulously went through all that data, and some of those had pretty unique -- some were much more loaded than others in different sites, and those -- we did study those, incorporate those into the entire modeling process as well. So we do have some information, and that

BROWN & JONES REPORTING, INC.  
414-224-9533

is summarized in the technical portion of this.

MR. SCHMIDT: Do you have a comment?  
It's Bill Krill.

MR. KRILL: I'm sorry. My name is Bill Krill. I'm an agent with -- William Krill, K-R-I-L-L, with HNTB Corporation in Milwaukee. I'm just responding to the gentleman's question and wanted to tell him that the Milwaukee Metro Sewerage District has an ongoing monitoring program for storm water, and I can grab one of my cards and tell him which person at the MMSD to talk to.

They have been monitoring storm water outfalls for about four years now with composite samplers, and maybe some of their data can help with what he's looking at. Thank you.

MR. MADSEN: Well, we're looking at developing some data for the Village of Wind Point and then implementing some things through that. We don't -- we don't put in direct collection systems. There are direct collection systems -- well, it's all ditched system, also. There's no curb and gutter in the Village of Wind Point -- well, there is some but very little.

And there we're looking to catch some of

BROWN & JONES REPORTING, INC.  
414-224-9533

that fertilizer that has flushed through the storm sewer system within the grass collection areas of the ditches. And there's small inlets within that, so we use those interim places for storm water storage.

And then the -- the gradings is not put in with solid pipe, it's put in with perforated pipe, so we get some undergrade stuff from -- which benefits our roadbeds. And that was part of the purpose of going to that type of a structure. If anybody wants to know anything about that, I can give you some information on that, too.

But we are looking at what is improving, not improving or deteriorating, and that's really what we're looking for.

MR. SCHMIDT: Thank you. Does anyone have any other comments particularly related to the plan or on the technical report?

If not, I think we can close the public hearing. If you have some questions, I'm sure Mike and the other gentlemen will try and help you for a while yet.

MR. HAHN: Sure.

MR. SCHMIDT: So I thank you all very much for attending this evening. And, like I say,

## I N D E X

Ms. Nenn..... 4  
Ms. Corres..... 11

## TRANSCRIPT OF PROCEEDINGS

MR. SCHMIDT: Good evening. My name's Daniel Schmidt. I'm a SEWRPC commissioner, and I serve as chairman of the Technical Advisory Committee that reviewed the information that Mike just went through.

This will be the beginning of the public comment portion, public hearing. And as Mike indicated, this is the second of three such programs.

Before getting into that, I just want to note that I'm just one of 32 members on the Technical Advisory Committee, and we've been meeting for four years currently. And those people are very dedicated, interested in what they're looking at and reviewing. We have a fantastic staff at SEWRPC that's been providing us the information, along with MMSD, the DNR, and so forth.

At those meeting, and we've been meeting almost monthly, or at least every other month, occasionally missing one, but we've been averaging a 66 percent attendance ratio at those meetings, so it's fantastic the commitment that these members have.

In reference to the public comment portion of this meeting, I would ask -- I'm going to lay the mike over here at the table, and I would ask that you identify yourself by giving your name for our stenographer, as well as your address.

If you're affiliated with a municipality, county, private or public agency, I would ask that you also give us that information for the record. And we'll begin with that comment portion.

Oh, also, if you wish to just comment, you know, in a written format, you may do so. There's forms in the back. That needs to be submitted by the 24th of October. If you want to speak, there are also forms back there that, you know, would provide us your name, and address, and so forth.

And, again, we need the information by the 24th because we are under a strict deadline.

I'll leave the mike on, so you don't have to mess with any buttons.

Does anyone have any public comment that they would like to make?

MS. NENN: I'll come.

MR. SCHMIDT: Fine. Come up, Cheryl.

MS. NENN: It's a small group. Just grab

06:10 1 this.

06:10 2 MR. SCHMIDT: Start out with your name.

06:10 3 MS. NENN: Sure. I'm Cheryl Nenn. I'm  
06:10 4 with Friends of Milwaukee's Rivers, and I'm also a  
06:10 5 member of the Technical Advisory Committee for the  
06:10 6 plan, so been participating in meetings for several  
06:10 7 years.

06:10 8 We're planning on submitting detailed  
06:10 9 written comments as well, but I just wanted to say  
06:10 10 that in general we're very supportive of the plan,  
06:10 11 with a couple of major concerns.

06:10 12 And those are -- We're still really  
06:10 13 concerned about the five-year level of protection  
06:10 14 for MMSD in particular. We really feel that the  
06:10 15 proposed five-year level of protection is illegal  
06:10 16 under federal and state law, and that MMSD, as well  
06:10 17 as all the other treatment plants in the basin,  
06:10 18 must eliminate SSOs, and have that as a goal, as  
06:10 19 well as addressing both point and nonpoint sources  
06:10 20 of pollution.

06:10 21 We -- Let's see here. You know, we're  
06:11 22 also -- we're very concerned about sanitary sewer  
06:11 23 overflows. We feel that planning for them as part  
06:11 24 of the Regional Water Quality Plan is unacceptable.

06:11 25 We certainly acknowledge that there's

BROWN & JONES REPORTING, INC.  
414-224-9533

06:11 1 special extreme wet weather conditions that cause  
06:11 2 overflows at times. However, we agree with the  
06:11 3 USEPA, and others, that prohibit affirmative  
06:11 4 defenses for SSOs. And what that means is it  
06:11 5 instead gives the state and federal government  
06:11 6 enforcement discretion to deal with these special  
06:11 7 circumstances that happen and cause sewage to be  
06:11 8 dumped in those situations.

06:11 9 And we feel that the law really exists to  
06:11 10 create a level playing field out there, and we're  
06:11 11 concerned about the potential regional and  
06:11 12 statewide precedents of allowing the five-year  
06:11 13 level of protection.

06:11 14 And we also feel it's unfair to the other  
06:11 15 treatment plants within the basin who are complying  
06:11 16 with the law and making the necessary expenditures  
06:11 17 to keep their sewage systems well-maintained,  
06:11 18 although, obviously, MMSD is a special situation.

06:12 19 We also realize that eliminating SSOs is  
06:12 20 a very costly endeavor, billions of dollars as Mike  
06:12 21 was mentioning. However, we -- you know, we feel  
06:12 22 strongly that the Clean Water Act does not allow  
06:12 23 for overflows in the name of cost effectiveness,  
06:12 24 and that zero overflows still need to remain the  
06:12 25 goal.

BROWN & JONES REPORTING, INC.  
414-224-9533

06:12 1 And while we certainly agree that costs  
06:12 2 need to be factored in when prioritizing our future  
06:12 3 actions, we don't feel that they can be an excuse  
06:12 4 to continue to violate the law and pollute the  
06:12 5 waterways.

06:12 6 And we feel that we shouldn't have to  
06:12 7 choose between safe and clean drinking water and  
06:12 8 adequate sewage treatment, or between having sewage  
06:12 9 in our basements or sewage in our rivers. These  
06:12 10 are false choices, and we need to do what we have  
06:12 11 to do.

06:12 12 And just really quickly, we also would  
06:12 13 like to -- we feel that holding the line on the  
06:12 14 inflow and infiltration is not enough, and that we  
06:12 15 must go after the inflow and infiltration more  
06:12 16 aggressively to achieve reductions.

06:12 17 Preventing those increases is of the  
06:12 18 utmost importance in dealing with regional sewer  
06:13 19 capacity issues. We encourage the future efforts  
06:13 20 and ongoing efforts to allocate funds for illicit  
06:13 21 discharge detection and elimination, detection of  
06:13 22 cross-connections and human fecal contamination,  
06:13 23 such as the work that's been started by MMSD and  
06:13 24 Sandra McClellan, as well as implementing new  
06:13 25 technologies to seal up the cracks and leaks in the

BROWN & JONES REPORTING, INC.  
414-224-9533

06:13 1 sewers.

06:13 2 We hope that MMSD, as well as other  
06:13 3 municipalities, move beyond holding the line on  
06:13 4 inflow and infiltration and move to aggressively  
06:13 5 decreasing it through regulations, incentives and  
06:13 6 enforcement actions.

06:13 7 We also -- While we definitely support  
06:13 8 increased secondary capacity at both South Shore  
06:13 9 and Jones Island, we continue to believe that  
06:13 10 sewage blending is unacceptable. We feel that  
06:13 11 blending or diversion around any stage of sewage  
06:13 12 treatment presents a threat to human health.

06:13 13 Although we understand that currently  
06:13 14 MMSD blends sewage, that they're in compliance with  
06:13 15 their permit, we feel the permit doesn't have  
06:13 16 standards for parasites, and viruses, and other  
06:14 17 bacteria that can make people sick.

06:14 18 At present blending is not allowed at  
06:14 19 South Shore, and we would be against any permit  
06:14 20 modifications allowing this to occur in the future.

06:14 21 We sincerely hope the physical chemical  
06:14 22 treatment pilot project is successful. However, if  
06:14 23 it's not successful, we don't agree that the next  
06:14 24 logical option should be sewage blending.

06:14 25 We support all the water course

BROWN & JONES REPORTING, INC.  
414-224-9533

06:14 1 improvements that Mike mentioned, the dam removal,  
06:14 2 the removal of concrete lining, impediments to fish  
06:14 3 migration. We're very strongly supportive of that,  
06:14 4 as well as all the collaborative efforts that are  
06:14 5 being talked about right now to implement the  
06:14 6 SEWRPC plan.

06:14 7 And we also encourage SEWRPC in their  
06:14 8 initial recommendations to come up with a more  
06:14 9 concrete recommendation on how to address the  
06:14 10 illicit discharges, as well as how to deal with  
06:14 11 problem outfalls that are discharging into our  
06:14 12 waterways.

06:14 13 And there are many of those where we're  
06:14 14 having a really hard time finding where the illicit  
06:14 15 connections are coming in because they're draining  
06:14 16 huge surface areas of the city. And so we feel  
06:15 17 that we need to actually look at some  
06:15 18 end-of-the-pipe treatment systems and other  
06:15 19 emerging technologies that are out there.

06:15 20 That was something that SEWRPC initially  
06:15 21 recommended as part of the plan. However, in the  
06:15 22 Technical Advisory Committee there was significant  
06:15 23 concern on the part of municipalities about how  
06:15 24 much that would cost and -- However, we really feel  
06:15 25 that it's important to look at those

BROWN & JONES REPORTING, INC.  
414-224-9533

06:15 1 end-of-the-pipe treatment systems, which have been  
06:15 2 successful in many other communities, and, you  
06:15 3 know, perhaps starting some pilot projects to look  
06:15 4 at that type of technology and whether it's worth  
06:15 5 looking at in the future.

06:15 6 And I think that's about it. We support  
06:15 7 all the nonpoint efforts in the plan. As Mike  
06:15 8 mentioned, full, you know, implementation of those  
06:15 9 parts of the plan are unlikely, based on the lack  
06:15 10 of state funding for NR 151, so we strongly  
06:15 11 support, you know, the state funding for the  
06:15 12 nonpoint initiatives and looking at more innovative  
06:15 13 sources of funding, to make sure, in particular,  
06:16 14 the agricultural component of the NR 151 is  
06:16 15 implemented.

06:16 16 The town utility district concept which  
06:16 17 Mike mentioned, to deal with private on-site  
06:16 18 systems, inspections of septic systems in the rural  
06:16 19 areas, there's pretty much very little funding  
06:16 20 right now and is very important.

06:16 21 And supporting all of the fertilizer  
06:16 22 reductions, co-ag reductions, et cetera, as well as  
06:16 23 protection of the primary environmental corridors.

06:16 24 So thanks for listening. I felt that  
06:16 25 someone needed to speak, so I figured I'd just do

BROWN & JONES REPORTING, INC.  
414-224-9533

06:16 1 my little stumpage but -- Thanks.

06:16 2 Cheryl, C-H-E-R-Y-L, Nenn, N-E-N-N, and  
06:16 3 I'm with Friends of Milwaukee's Rivers. Thank you.

06:16 4 MR. SCHMIDT: Thank you, Cheryl. Do we  
06:16 5 have anybody else that would like to make a public  
06:16 6 comment at this time? Again, you do have the  
06:17 7 option to do it in writing and get it to us. Yes,  
06:17 8 ma'am.

06:17 9 MS. CORRES: Haven't filled this out yet  
06:17 10 but --

06:17 11 MR. SCHMIDT: So long as you do before  
06:17 12 you leave. Give your name and address.

06:17 13 MS. CORRES: Hi. My name is Vivian  
06:17 14 Corres, C-O-R-R-E-S. I live in Milwaukee.

06:17 15 And I just want to say that I support the  
06:17 16 position of Milwaukee's -- Friends of Milwaukee's  
06:17 17 Rivers. And this summer the Friends of Milwaukee's  
06:17 18 Rivers held a program, an educational program, for  
06:17 19 seniors. I think we were about 50 in the program.  
06:17 20 And even though there's not many of us here tonight  
06:17 21 who participated in that program, and I came late  
06:17 22 because I was at a class, you should know that  
06:17 23 there are a lot of us as concerned citizens who do  
06:18 24 approve of the kinds of things that the Friends of  
06:18 25 Milwaukee's Rivers do.

BROWN & JONES REPORTING, INC.  
414-224-9533

06:18 1 And I think the strength is, if we're  
06:18 2 going to have any kind of viable society, that  
06:18 3 public officials need to work and listen to these  
06:18 4 public citizen volunteer groups, and maybe some  
06:18 5 people get a little bit of money because they have  
06:18 6 to live, and then there's a whole slew of us who  
06:18 7 are volunteers who support the few people that are  
06:18 8 working in these citizen-based groups.

06:18 9 And if you listen, things can be done.  
06:18 10 We're not at odds against each other. So I would  
06:18 11 highly recommend that you listen and take back the  
06:18 12 comments from Friends of Milwaukee's Rivers,  
06:19 13 because they're our citizens.

06:19 14 I'll be taking fifth graders out to count  
06:19 15 little creepy-crawlies next week with the Urban  
06:19 16 Economy Center. There are lots of things that we  
06:19 17 do. And we promote among our friends, and rain  
06:19 18 barrels, and all these other kinds of things.

06:19 19 So listen to us. And we're all on the  
06:19 20 same side, if you listen.

06:19 21 Thank you very much.

06:19 22 MR. SCHMIDT: Thank you, Vivian. Anybody  
06:19 23 else care to comment this evening?

06:19 24 (No response.)

06:19 25 MR. SCHMIDT: Again, if you're not

BROWN & JONES REPORTING, INC.  
414-224-9533

06:19 1 commenting tonight, I would encourage you to do so  
 06:19 2 by the 24th. As Mike indicated, we have a tight  
 06:19 3 deadline to comply with.

06:20 4 And I do appreciate all of you attending  
 06:20 5 tonight. We have another meeting scheduled for  
 06:20 6 next Tuesday evening at the Riveredge Nature Center  
 06:20 7 on the Ozaukee/Washington county line. If you  
 06:20 8 think of something you want to say, and you want to  
 06:20 9 say it out loud, you're welcome to come there.

06:20 10 I believe, if you have any questions, our  
 06:20 11 staff will be staying around briefly after the  
 06:20 12 meeting, until close to 7:00 o'clock, or  
 06:20 13 thereabouts. Feel free to ask any one of them a  
 06:20 14 question.

06:20 15 So thank you all for your participation  
 06:20 16 and hope to see you at upcoming meetings. Thank  
 06:20 17 you.

## TRANSCRIPT OF PROCEEDINGS

MR. SCHMIDT: Good evening, my name is  
Daniel Schmidt. I'm the chairman of the Advisory  
Committee for the Milwaukee River Watershed.

Just a brief -- long history on that  
committee. We have been meeting since 2003. The  
committee consists of 32 members. And I would  
indicate that we have met once a month or once  
every other month since the beginning of this  
committee and there's a couple committee members  
here that can attest to that.

At those meetings over the last four  
years, we've had about a two-thirds attendance at  
those meetings. So, when you're looking at a  
committee of 32 and that type of attendance, I  
think it speaks highly of all of those members.

As Mike indicated, this is going into  
the public common portion of the meeting, and I  
will do that in just a minute. But, what we would  
ask, if you haven't, you can sign a comment sheet  
and put your comments down in writing. You can  
state them publicly, we will get to that in just a  
moment, and the court reporter will take those.  
You can also submit them online or in writing to  
SEWRPC. But we ask that that be accomplished by

BROWN & JONES REPORTING, INC.  
414-224-9533

tomorrow afternoon. As Mike indicated, we have  
some strict deadlines we're trying to make and we  
ask for your cooperation regarding that.

We will go into the public comment  
portion now. I would ask that if you wish to  
comment, you first state your name clearly, and  
please stand up when you're doing that, as well as  
your address. And if you are affiliated with any  
unit of government, county, any public or private  
agency, please state that as well. It will help  
us tremendously. So, I open it up for public  
comment at this point.

MS. ROSE HASS LEIDER: Well, since no  
one wants to comment, I will. I'm notorious for  
that.

MR. SCHMIDT: Please state your name.

MS. ROSE HASS LEIDER: My name is Rose,  
second name, H-A-S-S, third name, L-E-I-D-E-R.  
I'm an Ozaukee County Supervisor for District  
No. 2 which has unincorporated villages and many  
rural people and a great deal of the farming area,  
parts of three different townships, the rural ones  
to the north.

And for many years, I sat on Great Lakes  
boards, and especially representing Lake Michigan,

BROWN & JONES REPORTING, INC.  
414-224-9533

06:10 1 and when I hear them talk tonight and we're  
06:10 2 talking water quality, maybe somewhere in the  
06:10 3 future or before this is done, I think you should  
06:10 4 do something to protect the Great Lakes out there,  
06:10 5 Lake Michigan. That's part of the lifeline of the  
06:10 6 people. No water, no life.

06:11 7 And I'm telling you, when they talk  
06:11 8 about selling the water away, that could be a heck  
06:11 9 of a disaster for the people that live in the  
06:11 10 Midwest. And I'm sure SEWRPC somehow can tell you  
06:11 11 the amount of water and usage and all that type of  
06:11 12 thing because they certainly are involved with  
06:11 13 doing surveys and mapping and that type of thing.

06:11 14 And because I think the Great Lakes are  
06:11 15 the greatest thing we have, our asset for life  
06:11 16 here, I'm asking that maybe you can address that  
06:11 17 in here, or isn't that allowed?

06:11 18 MR. HAHN: Well, we certainly will  
06:11 19 address your comment and we appreciate those  
06:11 20 comments. This plan is intended to address the  
06:11 21 quality of the Great Lakes as it relates to the  
06:11 22 near shore Lake Michigan area.

06:11 23 In terms of the quantity, that's a  
06:11 24 separate planning effort that we're working on  
06:11 25 right now, there's a regional water supply plan

BROWN & JONES REPORTING, INC.  
414-224-9533

06:11 1 going on, and that would address some of those  
06:12 2 other issues that you mentioned.

06:12 3 So, on those two fronts, we're  
06:12 4 addressing them. This plan is limited primarily  
06:12 5 to water quality issues and water quality in the  
06:12 6 streets and the near shore area of Lake Michigan.

06:12 7 MS. ROSE HASS LEIDER: That would be  
06:12 8 another study?

06:12 9 MR. HAHN: There's a regional water  
06:12 10 supply plan that's being conducted right now.

06:12 11 MR. SCHMIDT: That's being conducted in  
06:12 12 -- I believe I'm correct, that should start  
06:12 13 winding to the point of public hearings and so  
06:12 14 forth next spring.

06:12 15 MR. HAHN: Yeah, sometime next year,  
06:12 16 yes.

06:12 17 MS. ROSE HASS LEIDER: And the other  
06:12 18 part of my comment you're probably not going to  
06:12 19 like very well, that's subject number two, is the  
06:12 20 raw sewage going into Lake Michigan. For years,  
06:12 21 it's been my pet peeve, because you blame the cows  
06:12 22 and the farmers for everything, and I think the  
06:12 23 raw sewage is the most disastrous of anything you  
06:12 24 can put in that lake because we need that water  
06:12 25 for drinking and a lot of purposes.

BROWN & JONES REPORTING, INC.  
414-224-9533

06:12 1 Kids swim in it. People swim in it. We  
06:13 2 eat the fish. In fact, you can't even get chubs  
06:13 3 anymore. They're gone. You have to import them  
06:13 4 to smoke them. And I think it's a shame, a  
06:13 5 downright shame that for years and years, the raw  
06:13 6 sewage is there.

06:13 7 And I sit here and look at a map on that  
06:13 8 screen, "Oh, we're doing better, we're doing  
06:13 9 better." Yeah, when I got a cold, if I take a lot  
06:13 10 of medicine, I'm doing better, but it's probably  
06:13 11 back in another month. There's no reason why they  
06:13 12 can't address it and do something.

06:13 13 Yeah, I know it takes money. But a fine  
06:13 14 doesn't cost much, so we let it go and then come  
06:13 15 back next year and say, "Well, we did a little  
06:13 16 better." And I know Milwaukee Metropolitan Sewer  
06:13 17 District is there and trying to come up with some  
06:13 18 ideas, but I can't see why they can't do something  
06:13 19 and protect that lake from the raw sewage.

06:13 20 Because I think it's all political.  
06:13 21 Thanks, guys. But maybe I'm counting on you to do  
06:14 22 something and not just tell me that it's getting  
06:14 23 better. Thank you.

06:14 24 MR. SCHMIDT: Thank you, Rose. Would  
06:14 25 someone else -- yes, ma'am.

BROWN & JONES REPORTING, INC.  
414-224-9533

06:14 1 MS. MARILYN JOHN: Yes, I read some --

06:14 2 MR. SCHMIDT: Excuse me. State your  
06:14 3 name and --

06:14 4 MS. MARILYN JOHN: Marilyn John,  
06:14 5 Watertech Washers (phonetic). I read some of the  
06:14 6 report on the web, and I got a sense that there  
06:14 7 was a great deal of contamination in the water and  
06:14 8 that it was affecting fish. And this kept going  
06:14 9 throughout the pages that I read, and I know  
06:14 10 there's more to it than what I read, but I was a  
06:14 11 little discouraged with that.

06:14 12 And I was wondering what the plan is to  
06:14 13 correct this because we also have a lot of  
06:14 14 wetlands that are being destroyed. And there's an  
06:14 15 article in the paper where -- was it Mr. Lieder  
06:14 16 (phonetic) -- who was concerned about the number  
06:14 17 of wetlands that were being destroyed and they  
06:15 18 were really upset about this. Well, the rest of  
06:15 19 us are upset about this, too.

06:15 20 So, with all of this great planning and  
06:15 21 we see all this reporting, what is -- I know that  
06:15 22 there is an implementation. But is this going to  
06:15 23 take care of some of these problems, or is it just  
06:15 24 another big show and nothing is going to really  
06:15 25 come of all of this?

BROWN & JONES REPORTING, INC.  
414-224-9533

06:15 1 MR. SCHMIDT: I'll try and address a  
06:15 2 little bit of it, and Mike can maybe jump in.  
06:16 3 We're hopeful that this will take care of some of  
06:16 4 that. But as Mike also indicated, we want and  
06:16 5 need all 88 municipalities and nine counties to  
06:16 6 support those recommendations that are before us.

06:15 7 And as Rose indicated, money is always a  
06:15 8 very strong factor in everything and, you know,  
06:15 9 we're trying to put in a list of grant information  
06:15 10 out there. We've had people, you know, from the  
06:16 11 DNR on the committee. Everybody is bringing their  
06:16 12 knowledge forward. And we're very hopeful that we  
06:16 13 can help and improve the situation. Mike, did you  
06:16 14 --

06:16 15 MR. HAHN: Sure. The plan is intended  
06:16 16 to address the kind of problems that you talk  
06:16 17 about. Now, it's not probably going to be talked  
06:16 18 about and addressed quite as fully as we might  
06:16 19 like at this point, but we have come up with a  
06:16 20 good approach to achieving improvement in water  
06:16 21 quality.

06:16 22 The difficult part is implementation.  
06:16 23 It always had been implementation. And since the  
06:16 24 1979 plan was issued, a lot has been done in terms  
06:16 25 of implementation to improve water quality by

BROWN & JONES REPORTING, INC.  
414-224-9533

06:16 1 controlling point sources and an additional amount  
06:16 2 has been done for non-point sources. This just  
06:16 3 carries that even further.

06:16 4 And as Dan mentioned, it will be a  
06:16 5 challenge coming up with the funding necessary to  
06:16 6 meet these goals. But we have laid out a roadmap,  
06:17 7 any way, as to how to get there and we will be  
06:17 8 pursuing implementation in the future.

06:17 9 MS. MARILYN JOHN: So the funding is the  
06:17 10 barrier here?

06:17 11 MR. HAHN: Yeah, it's a huge impact,  
06:17 12 certainly.

06:17 13 MS. MARILYN JOHN: What has been done to  
06:17 14 get some the funding in the past and in the  
06:17 15 future? Because this is a very serious subject.  
06:17 16 And I haven't even gotten to the wetlands yet.  
06:17 17 But I would like to know what is going to be done  
06:17 18 about the contaminants in the water, to start  
06:17 19 with.

06:17 20 MR. HAHN: Well, I can't give you a  
06:17 21 short answer. We'll try and address it a little  
06:17 22 bit more. The whole report says what's going to  
06:17 23 be done about contaminants and what I just  
06:17 24 presented said what would be done about  
06:17 25 contaminants. It's detailed in the report, but

BROWN & JONES REPORTING, INC.  
414-224-9533

06:17 1 this was just kind of an overview.

06:17 2 MS. MARILYN JOHN: Well, I read it and I  
06:17 3 didn't get the sense that it was anything  
06:17 4 imminent. You know, there are a lot of  
06:17 5 contaminants out there that -- they're in the  
06:18 6 streams and they're in the lakes and they're going  
06:18 7 to be in our bodies, eventually.

06:18 8 MR. SCHMIDT: Again, as far as the  
06:18 9 specifics, you would have to go back to the  
06:18 10 report. We're trying to summarize something  
06:18 11 that's very detailed in a very small amount of  
06:18 12 time. And if -- one of the hurdles is if we don't  
06:18 13 have the recommended plan -- and that's what it  
06:18 14 is, a recommended plan put forward by this  
06:18 15 Advisory Committee to the Regional Plan  
06:18 16 Commission.

06:18 17 And as indicated earlier, the Plan  
06:18 18 Commission is the agency that is looked at for  
06:18 19 their recommendations and that's how the grants  
06:18 20 and funds will be made. If we wouldn't have that  
06:18 21 plan, those grants wouldn't be forthcoming to any  
06:18 22 one of our 88 communities or nine counties.

06:19 23 MR. HAHN: And I just might say that we  
06:19 24 will -- it's our intention, all of the formal  
06:19 25 comments made at this public hearing portion and

BROWN & JONES REPORTING, INC.  
414-224-9533

06:19 1 also any written comments we receive, we will  
06:19 2 address those in the plan. So, I'm doing my best  
06:19 3 to do it now, but I think the best place is in the  
06:19 4 summary and conclusion section of the plan. We  
06:19 5 will address the comments, and then we can cite  
06:19 6 directly, maybe, toward specific parts of the plan  
06:19 7 with the issues that you phrase.

06:19 8 MS. MARILYN JOHN: Can we also send in  
06:19 9 comments?

06:19 10 MR. SCHMIDT: Yes. But we would ask  
06:19 11 that you try and get that in no later than  
06:19 12 tomorrow because we are on a very strict time  
06:19 13 table. Yes, sir.

06:19 14 MR. TIMOTHY JOHN: I'm Timothy John and  
06:19 15 I'm a member of Milwaukee Rivers, and I'm working  
06:19 16 on a book to try and understand and explain some  
06:19 17 of these things.

06:19 18 Have you done much work trying to  
06:19 19 determine what, let's see, a pre-settlement river  
06:20 20 looked like? You know, let's say we could and we  
06:20 21 will continue to clean, clean, clean. Well, there  
06:20 22 are some minerals and oxygen levels, I'm sure,  
06:20 23 fluctuating from season to season. But is that --  
06:20 24 has anything been done to establish what would be  
06:20 25 a perfect scenario that is agreeable to different

BROWN & JONES REPORTING, INC.  
414-224-9533

06:20 1 experts?

06:20 2 MR. HAHN: That's a very good point, and  
06:20 3 that was also raised by our Advisory Committee,  
06:20 4 and it has not been done, it wasn't part of this  
06:20 5 study, but it would be an interesting exercise to  
06:20 6 try and represent those kinds of conditions.

06:20 7 Now, to what degree of certainty we can  
06:20 8 represent them, I'm not sure. Because it would be  
06:20 9 difficult to really turn back the clock in terms  
06:20 10 of even knowing what process these might have been  
06:20 11 working back at that time in a physical nature.

06:20 12 And if you look, there's a display  
06:20 13 board, not one of ours, actually, but one of  
06:20 14 Riveredge's in the back of the room, that shows  
06:20 15 just the way the stream system evolved over time  
06:20 16 and it's been highly modified in certain areas.  
06:20 17 So, it would be difficult to reproduce that, but  
06:21 18 it would be very instructive to know what kind of  
06:21 19 a background level would be.

06:21 20 MR. SCHMIDT: Just as a note, we do have  
06:21 21 a member on our committee from Friends of  
06:21 22 Milwaukee Rivers. Cheryl (phonetic) is on it.  
06:21 23 Yes, ma'am.

06:21 24 MS. ROSE HASS LEIDER: I have just one  
06:21 25 more thing. Rose Leider again. And this is

BROWN & JONES REPORTING, INC.  
414-224-9533

06:22 1 MR. SCHMIDT: Thank you. And Andy is  
06:22 2 also one of the 32 on the committee and he's been  
06:22 3 very active.

06:22 4 MS. MARILYN JOHN: That's an example of  
06:22 5 implementation and I think that's excellent.

06:22 6 MR. SCHMIDT: Do you have any other  
06:22 7 comments? Well, on my behalf, as well as  
06:22 8 SEWRPC's, I would like to thank you all very much  
06:22 9 for attending this evening. And the court  
06:22 10 stenographer will stay for a while, as well as the  
06:23 11 gentlemen, and try to answer any questions  
06:23 12 privately you have, or if you want to comment  
06:23 13 privately and record it, you can still do that. I  
06:23 14 appreciate you coming very much. It's been a  
06:23 15 four-year process to get to this point, and we  
06:23 16 appreciate it, all of us. Thank you.

17 (Proceedings concluded at 7:00 p.m.)

06:21 1 positive for what's going on. And I have to thank  
06:21 2 -- Andy Hulsbeck (phonetic) is the head of our  
06:21 3 land conservation in Ozaukee County, and him and  
06:21 4 his crew do a very good job.

06:21 5 And one of the things they have been  
06:21 6 pushing the last ten years is for -- I have farms  
06:21 7 and a fine herd of cattle, and what they're  
06:21 8 pushing is the manure storage so that it can be  
06:21 9 controlled and not put out on the fields during  
06:21 10 winter when it runs in the streams.

06:21 11 Well, we listened to Andy, and we put in  
06:21 12 the harvester and manure storage and took the milk  
06:21 13 house waste and ran it into the harvester, and  
06:22 14 it's probably the best thing we have ever done on  
06:22 15 the farm, Andy. You talked us into it, it's  
06:22 16 working wonderful, and it's helping the  
06:22 17 environment.

06:22 18 And I compliment land conservation in  
06:22 19 Ozaukee County. I'm on that board, too. But I'm  
06:22 20 telling you, they're out there trying to do their  
06:22 21 job well, and I personally know it worked.  
06:22 22 Because that's, like, five years, and we really,  
06:22 23 really know that it's helping the environment. It  
06:22 24 was worth every cent it cost. So, that's a plus  
06:22 25 for what you're talking --

P.O. Box 1607  
Waukesha, WI 53187-1607

Dear Mike,

On behalf of Friends of Milwaukee's Rivers (FMR) and our partners at the Sierra Club Great Waters Group, the Milwaukee County Conservation Coalition, and the Natural Resources Defense Council, thank you for the opportunity to comment on the findings and recommendations in the Southeastern Wisconsin Regional Planning Commission's (SEWRPC) Regional Water Quality Management Plan Update for the Greater Milwaukee Watersheds (Plan). This Plan includes recommendations pertaining to land use, surface water quality and groundwater quality in the Greater Milwaukee Watersheds and nearshore areas of Lake Michigan. This Plan was prepared in partnership with the Milwaukee Metropolitan Sewerage District's (MMSD) 2020 Facilities Plan, which identifies the facilities, programs, operational improvements, and policies (FPOPs) required by the year 2020 to meet the existing regulatory framework and permitting requirements in the State of Wisconsin.

FMR appreciates the opportunity to serve on SEWRPC's Technical Advisory Committee, and we submit the following comments in a spirit of cooperation to ensure that SEWRPC's Regional Water Quality Management Plan protects our water quality, wildlife habitat, public health, and quality of life to the greatest extent possible.

**Comment: The proposed 5-Year Level of Protection for Sanitary Sewer Overflows (SSOs) is illegal under Federal and State law. MMSD (and other treatment plants) must eliminate SSOs and address both point and non-point sources of pollution affecting our waterways.**

As stated in Plan documents for both the MMSD 2020 Facilities Plan as well as the SEWRPC Plan, MMSD is setting forth ongoing investments and facilities improvements to be made in order to provide a 5-year target level of protection (LOP) for sanitary sewer overflows (SSO) and "adequate treatment" under the projected 2020 population and land use conditions. This essentially states that sanitary sewer overflows of sewage will continue to occur and can not be eliminated in the next 20 years, nor will striving for this be a goal of this water quality plan. Sanitary sewer overflows are clearly illegal under the Clean Water Act and prohibited under State permits designed to protect our public health and environment. Planning for SSOs as part of the MMSD Facilities Plan and related Regional Water Quality Plan is unacceptable. While we acknowledge that there may be special extreme weather conditions that cause SSOs, we agree

with recent US EPA guidance that prohibits affirmative defenses for dumping sewage, instead giving our State and Federal regulatory agencies appropriate enforcement discretion to deal with these special circumstances. Furthermore, the law exists to create a "level" playing field, and we are concerned about the regional and statewide precedence of illegally allowing MMSD to have a 5-year level of protection. This is also not fair to the other treatment plants in southeastern Wisconsin who are complying with the law and making the necessary expenditures to keep their sewerage systems well maintained.

**Comment: Cost effectiveness can be used to prioritize future actions but not to justify continuing pollution of our waterways.**

Although we realize that eliminating SSOs is a costly endeavor, the Clean Water Act does not allow for overflows in the name of cost effectiveness, and zero overflows need to remain the goal. While we agree that costs should be factored in when prioritizing future actions, cost cannot be used as an excuse to continue to violate the law and pollute our waterways. Citizens should not have to choose between safe and clean drinking water and adequate sewage treatment, or between having sewage in our basements and sewage in our rivers. These are false choices.

**Comment: We encourage SEWRPC to set more concrete water quality goals, which allow agencies and organizations to focus time and attention on addressing specific problems, as well as ensure that we all remember the ultimate goal of improving water quality.**

As currently written, the ultimate goal of the SEWRPC Plan is to develop a watershed based plan that addresses water pollution sources cost-effectively and meets designated water use objectives and water quality standards to the degree possible. This is vague and uninspiring. Establishing more outcome focused or performance driven goals (e.g. Milwaukee River swimmable by 2010), provides some context for where agencies should focus their efforts, and performance based goals also better resonate with the public as they are clear and easy to understand. Such goals would also give us a way to continually communicate our progress and be a stronger motivator for action.

**Comment: The SEWRPC Regional Water Quality Plan (208 Plan), must comply with Clean Water Act fishable and swimmable goals, and address antidegradation requirements regardless of cost-effectiveness.**

The Regional Water Quality Plan does address both watercourse and habitat components, which along with physical/chemical water quality and compliance with discharge permits collectively influence the quality of our surface waters. However, given the vagueness of the Plan and the lack of concrete objectives for water quality improvements, as mentioned above, it seems doubtful that this Plan will adequately address fishable/swimmable goals and antidegradation requirements (e.g. backsliding or deteriorating water quality is prohibited under the law) under the Clean Water Act. There are no concrete goals, objectives, or timelines for ensuring that our waterways don't further degrade nor improve to meet fishable/swimmable goals. Last week, the Clean Water Act turned 35 years old, and we are still far from fishable/swimmable waters.

The waters of the Milwaukee River Basin have not been protected as envisioned under the Clean Water Act, and decisions have been made over the years by the regulatory agencies such that the goal requirements of the Clean Water Act have not been met. Although many of those decisions were logical and sound at the point in time they were made, we are left with rivers that do not

meet fishable/swimmable requirements and current water quality standards that do not protect fishable/swimmable uses as they should. In addition, many of our local waterways have "variance" standards, which provide them with much lower levels of protection than baseline State water quality standards. This is in stark contrast to all our available data that shows the waters of the Milwaukee River Basin are being increasingly used for all forms of recreation: fishing, canoeing, kayaking, sculling, and in some areas, wading, swimming, and water skiing.

We will never meet fishable/swimmable standards without looking comprehensively at both point source and non-point source controls, as well as a mix of "soft" or "green" approaches and "grey" or "infrastructural" approaches. The SEWRPC Plan has made a good effort to identify both point and non-point source solutions; however, acknowledging that there is currently little funding to deal with many of these problems. Coupled with lack of clear goals, it seems that there are little incentives or disincentives to push us away from the status quo. In order to manage both non-point and point source controls to meet fishable/swimmable standards, we will need to increase sources of funding and find more innovative solutions to improving water quality. We realize that this is politically unpopular; however, pretending that we can improve water quality by shifting money from infrastructural projects to non-point demonstration projects without raising additional funding levels is unrealistic. Again, we cannot practice an "either/or" approach to pollution (e.g. spend all our money on non-point pollution to get more "bang for our buck") and expect to meet fishable/swimmable standards throughout both our rural and urban waterways. We must strive to meet general use recreational standards in all of our waterways, and work to upgrade our stream health and not continue to meet only variance standards. This will require creative funding and policy mechanisms, which have not been identified or recommended in the Plan.

We understand that MMSD has been talking about watershed permitting, watershed trading, and other mechanisms, which could improve water quality. Given the role of SEWRPC in planning for regional water quality, it would seem appropriate that SEWRPC analyze existing models in use throughout the country and make some solid recommendations of crucial policy and technical components that should be part of these types of efforts.

**Comment: Holding the line on inflow and infiltration (I/I) is not enough. We must go after I/I more aggressively and achieve reductions.**

Preventing increases in infiltration and inflow (I/I) of our sewerage infrastructure (e.g. leaky pipes, manholes, etc.) is of the utmost importance in dealing with our regional sewer capacity issues. We encourage future efforts to allocate funds for illicit discharge detection and elimination, detection of cross-connections and human fecal contamination of stormwater (e.g. Great Lakes Water Institute work on *E. bacterioides* monitoring, etc.), as well as implementing new technologies to seal up cracks and leaks in our sewers through the use of "liners" and other new practices. However, we hope that MMSD and other municipalities could move beyond "holding the line" on I/I and move to decreasing I/I through increased regulations, incentives, and enforcement actions. MMSD's 2010 Facilities Plan called for a 5% decrease in I/I, and the goal for I/I reductions for the 2020 Plan and SEWRPC Plan should be even more stringent. Given the probability of increasingly volatile storms with global warming, we need to do much more than "hold the line" on I/I if we hope to have enough existing sewer capacity to deal with wet-weather events.

**Comment: While we support increasing secondary capacity at South Shore Treatment Plant, sewage blending is unacceptable.**

We encourage additional secondary treatment capacity at both Jones Island and South Shore Treatment Plants to eliminate the need for sewage blending. Blending or diversion around any stage of sewage treatment presents a threat to human health. We understand that when MMSD "blends" sewage at Jones Island that they are in compliance with their State WPDIS permit; however, this permit does not have standards for parasites, viruses, and other bacteria that can make people sick. At present, blending is not allowed at South Shore Treatment Plant and we would be against any permit modifications allowing this to occur. We hope that the physical-chemical treatment pilot project currently being proposed is successful. However if it is not successful, we do not agree that the next option should be blending based on cost-effectiveness.

**Comment: We do not support the efforts of MMSD and customer communities to obtain regulatory recognition of the integrated nature of the MMSD system.**

We understand that the effort by MMSD and some customer communities to obtain regulatory recognition of the integrated nature of the MMSD system by EPA is to ultimately lead to possible elimination of the distinction between tunnel-related SSOs and CSOs. This effort fails to recognize the very different nature of SSOs and CSOs, as well the fact that SSOs are illegal under existing federal law, and it is very unlikely that the Clean Water Act would be changed for southeastern Wisconsin. If during rain events, the physical-chemical constituent elements of SSOs and CSOs is similar as suggested by local consultants, than that just stresses the very dire state of our current infrastructure, allowing excessive inflow and infiltration into our separate sewer system, and likewise the need to address this I/I.

On a related note, there has been extensive emphasis on focusing on fecal coliform as a parameter of concern in both the SEWRPC and MMSD Plans and models, as well as graphs created showing that fecal is mostly coming now from non-point and not point sources. These graphs are meant to illustrate that we are much better off spending our "next dollar" on non-point sources of pollution instead of point sources of pollution. However, this focus on fecal coliform and interpretation of the data is in many ways disingenuous and completely off target. While we realize that non-point pollution is a significant source of pollution, we can not fail to recognize several things. First, that fecal coliform as an overall parameter of water quality and public health is not ideal. It is ubiquitous in the environment, and not normally indicative of human health risk. For this reason, EPA has been mandated to come up with a new parameter for measuring beach health, and researchers such as Sandra McClellan (with support by MMSD) have been researching better bacterial indicators that are more indicative of human health risk. Second, just focusing on fecal coliform and the predominant non-point sources of this bacteria do not address the fact that SSOs and CSOs, while a smaller piece of the "pie" as far as sources, contribute other bacteria, viruses, and parasites that make people sick. Furthermore, much of the fecal coliform and pollution in the "non-point" urban and rural stormwater is likely coming from failing sewerage infrastructure in the urban areas, and failing septic in the rural areas, so is not without human influence. It seems clear that spending more money on typical non-point BMP projects, while sorely needed, will not address our bacterial loads if we fail to deal with these so-called "nonpoint" sources that are really point sources of pollution. This approach will also not lead us to fishable and swimmable waters.

**Comment: We support watercourse improvements to improve physical-chemical water quality as well as fishable/swimmable goals.**

Although some people don't feel that the costs of watercourse improvements such as concrete channel removal and dam removal warrant the minimal improvements in water quality, we disagree. Removal of concrete channel and other related stream restoration projects to naturalize our urban streams, improves water temperature and water quality, provides resting places and habitat for fish, and makes our streams less dangerous to adjacent communities especially during flooding events. We support funding for watercourse improvements identified in the SEWRPC plan, as well as recommendations on eliminating barriers to fish migration where possible such as dams, perched culverts, etc.

**Comment: We support collaborative efforts to implement solutions to non-point runoff and other sources of pollution as identified in SEWRPC's Regional Water Quality Management Plan.**

We encourage SEWRPC and MMSD to continue to work collaboratively with the community toward establishing a region-wide commission (e.g. Milwaukee Regional Partnership Initiative) to help plan and implement solutions for non-point runoff and other sources of pollution that affect water quality and quantity in southeastern Wisconsin's watersheds. However, we encourage these agencies to meaningfully involve the public at early stages of subsequent planning efforts, whether it be more specific sub-watershed plans created as a follow-up to the current planning effort or a TMDL planning process. Moving forward, it is recommended that the public be allowed the opportunity to review how the models are set up, specifically data (both depth and breadth) that are being used as inputs to these models, data gaps, model assumptions, etc. We would also recommend external peer review of these new modeling efforts to ensure that we are doing everything we can to protect our surface waters and capitalize on successes and learning experiences of others.

**Comment: We encourage SEWRPC to come up with more concrete recommendations on how to more aggressively deal with illicit discharges to our waterways, as well as how to deal with problem outfalls discharging into our waterways where illicit discharges can not be detected. These may include end of the pipe treatment systems and other emerging technologies.**

Although many municipalities are understandably concerned about the costs of such stormwater treatment technologies, we feel that it is appropriate to conduct research and/or implement demonstration project(s) locally that could help determine the effectiveness of end of the pipe treatment systems, which have been very successful in other communities with failing infrastructure where illicit connections or infrastructure problems can not be detected due to the large drainage areas connected to these pipes. Our extremely high bacteria levels in many of our urban streams, coupled with low funding levels for detecting illicit discharges, warrant more examination of these technologies.

**Comment: SEWRPC has provided solid evidence that orthophosphate, which was added to the water treatment systems of many area communities in the late 90s as an anti-corrosion inhibitor for drinking water pipes, is causing demonstrable spikes in phosphorus in many of our area rivers. We stand by SEWRPC's recommendation that municipalities**

5

**using this inhibitor look for alternatives to orthophosphate that still protect our drinking water supply as well as minimize nutrient pollution of our rivers and Lake.**

Increasing levels of phosphorus from a variety of sources, including fertilizer use and anti-corrosion inhibitors (added to limit leaching of lead from pipes into drinking water), are likely contributing to algal blooms of *Cladophora* affecting our beaches. These blooms are being exacerbated by zebra mussels, which are contributing to increased clarity of the water and cycling of nutrients, which create conditions for this algal growth. Even though orthophosphate is not the greatest source of phosphorus to our rivers, we need to look at easy ways and "quick wins" to reduce nutrients in our rivers, as well as legislative and policy avenues, which could include phosphorus bans in fertilizers, dishwashing and laundry detergents, etc.

**Comment: We support the proposed protection of both Primary Environmental Corridors and Agricultural Buffers as proposed in the land use element of the Plan.**

Given the large component that non-point runoff from both urban stormwater and agriculture play in polluting our waterways, it is appropriate to recommend the protection of our riparian corridors in the Plan. Furthermore, it is appropriate that agricultural buffers be at least 75 feet wide, which is consistent with both State Shoreland Development Rules (NR115) as well as scientific consensus on the buffer width needed to adequately protect our waterways. We would encourage SEWRPC to prioritize where these buffers should be created, if possible, based on information from our models and taking in consideration erodibility of area soils, slope of riparian areas, land use, etc. This would be a great tool for area land trusts and agencies that acquire land in the area—and could target properties whose conservation would be most protective of water quality.

**Comment: We support SEWRPC recommendations to create town utility districts to deal with inspection, and possibly repair, of private onsite treatment systems or septic systems.**

Given lack of funding for inspection of private onsite treatment systems throughout Wisconsin and the high probability that many of these systems within the area are old and potentially failing, it is prudent that towns and municipalities with residential septic systems create a mechanism, similar to stormwater utility districts that are being employed throughout the area (e.g. Milwaukee, Elm Grove, etc.), to provide a source of funding for inspection, and perhaps maintenance, of septic systems. Given the high bacterial levels in our local rivers, we must do a better job of identifying and eliminating bacteria both in our urban areas (with more illicit discharge detection) and in many rural areas (with control of septic releases and agricultural runoff).

**Comment: We urge SEWRPC to recommend state regulations and local ordinances to more effectively deal with both urban and rural non-point pollution.**

We support SEWRPC's efforts to recommend the reduction of fertilizer use and road salt that impair our local waterways with nutrients and chloride respectively, as well as their efforts to promote best management practices to limit land use practices that cause runoff that pollutes our waterways. SEWRPC did recommend ordinance changes in areas where runoff is currently affecting inland lakes, although stopped short of advocating for a phosphorus ban in all fertilizers. We would encourage SEWRPC to readress these recommendations and recommend that all municipalities, with discharges to either our inland lakes or rivers, consider ordinances

6

banning phosphorus from fertilizers, as well as encourage the use of road salt alternatives, which are friendlier to our waterways.

Likewise, we support SEWRPC recommendations relating to fuller implementation of NR 151 runoff rules, manure and nutrient management, controls on barnyard runoff, managing milking center wastewater, and restricting livestock access to streams. We would recommend that SEWRPC recommend state rules or county ordinances to restrict livestock access to streams, as there are currently no rules to deal with this situation. We have had problem farmers in the past brought to our attention, and if the counties do not provide cost-share funding or don't think these farms are a priority given their limited funding levels, farmers are unwilling to restrict access to streams of their livestock. Not only do these livestock and their waste add to our significant bacterial loads in our rivers, they also cause extensive disturbance of the streambanks and riparian habitat, contributing sedimentation to our waterways.

**Comment: SEWRPC should propose more specific management measures and monitoring to deal with emerging pollutants of pharmaceuticals and personal care products if possible.**

While the Plan does address these emerging pollutants in a general sense as well as provides the limited information that we do have on detection and levels of some of these products in our waterways, it falls short of offering recommendations to deal with these emerging pollutants, other than the recommendation to conduct pharmaceutical and personal care product collection programs. There is already considerable science showing the effects these pollutants are having on aquatic organisms that are exposed to a spectrum of substances that persist in treated effluent from sewage facilities. Given that EPA estimates that sewage treatment only removes roughly 60% of pharmaceuticals and personal care products, while acknowledging that treatment can span the spectrum of complete treatment for some substances to nonexistent for others, we would urge SEWRPC to make recommendations for sewage treatment facilities on how to more effectively address these contaminants, where possible. Likewise, these substances are also showing up in some of our area groundwater, presumably coming from leaky septic systems and sludge spread on the land (both from sewage treatment plants and livestock waste). We understand that little is known on this subject, but would recommend that SEWRPC make recommendations where possible. We also advocate for increased monitoring for substances of particular concern, both in our surface waters as well as effluent of our treatment plants and influent waters for our drinking water facilities.

**Comment: We support SEWRPC recommendations to more aggressively identify and address local sources of beach contamination.**

Given recent monitoring information that much of our beach contamination comes from local sources and stormwater runoff, it is prudent to recommend more comprehensive monitoring to identify and address sources of beach contamination, especially of bacteria. If local municipalities can not find the sources of bacterial contamination, they should ensure that these beaches are closed when they are not safe for the public to use. While many local beaches in Milwaukee are monitored extensively, there are many others that are only monitored weekly or less along the lakeshore, and residents should know that these beaches are not being monitored or frequency of monitoring through signage or another means so they can make their own decisions about beach use. Furthermore, if bacteria sources can not be found, municipalities

7

should be urged to provide end of the pipe stormwater treatment systems and stormdrain filters that would remove considerable amounts of bacteria before it can contaminate local beaches.

**Comment: Upgrade citizen based monitoring programs and continue to support existing monitoring by agencies and expand monitoring efforts into local tributaries.**

We support the SEWRPC recommendation to continue existing MMSD, WDNR, and USGS monitoring programs, and to continue to upgrade citizen based monitoring programs. These programs, besides providing useful data, connect local residents to their water resources and educate them about their personal impacts on water quality. We also support efforts to modify or expand existing monitoring programs to include more extensive monitoring on our area tributaries, as well as to add fishery and macroinvertebrate monitoring stations along our waterways. These are also programs where citizens could provide much needed monitoring support. The paucity of fishery and macroinvertebrate data for many of our waterways was surprising, and increasing monitoring of these organisms is especially important as we monitor our progress towards fishable and swimmable waters and implement this Plan.

Thank you for your consideration of these comments. Please feel free to call with any questions at (414) 287-0207 ext. 29.

Comment - expand ACC to entire watershed because of poorly regulated farm  
practices upstream, loss of riparian/undeveloped lands to housing & other  
purposes, development in West End, sewerage treatment, & poor water runoff  
- include Milwaukee River Environmental Corridor, between N. Ave. down  
side to S. Ave. to support efforts to improve Central Park - increase  
require to practice BMP at all facilities  
- begin to separate sanitary sewage from surface runoff by sealing  
existing storm sewers with fabric mesh bags  
- finance work by changing financial responsibilities from homeowner  
responsible to municipality to curb - municipality  
sewer charges from curb to main - begin mandatory testing, bring  
phase-out snow-melt chemicals in area of small & medium-sized

**Public Comment from the League of Women Voters Milwaukee County**

1. The Regional Water Quality Management Plan Update is a good structure for coordinating community efforts towards improving water quality using the Watershed Approach. Importantly MMSD and SEWRPC have developed much data so that efforts can be targeted towards real pollution sources.
2. It is unfortunate to allow CSOs or SSOs into our drinking water and recreational waters. The League of Women Voters of Wisconsin was active in state implementation of the federally mandated Safe Drinking water amendments of 1986 and 1996 to clean up WI's waters sufficiently to reach the federally mandated "swimmable, fishable waters" standard. We think that I/I should be aggressively reduced. Lets not just "hold the line" on I/I but reduce it. Service communities need to do their part in reducing excess rainwater coming into the sewerage collection system so that sewerage systems handle sewerage, not rainwater and, hopefully, CSOs and SSOs can be eliminated.
3. Communities need to be responsible for eliminating Illicit Discharges (human sewerage) into the storm water system which drains into rivers and Lake Michigan. We commend the effort, which allows us to distinguish between human waste and other waste in our storm water management system.
4. State funding is not adequate for inspections and grants to abate water pollution due to agricultural practices or urban runoff. In 2003 the League Women Voters of WI determined that the dedicated revenue sources for water quality programs were insufficient and proposed that new or reallocated funds should be combined with General Purpose Revenues to meet WI's needs for management of its water resources.
5. Monitoring for viruses and parasites in streams and lakes should be required, not just for *E. coli*, oxygen, phosphorus, etc., although these parameters are also important indicators of water quality.
6. We have concerns about sewerage blending, which means disinfecting sewerage faster than normal way with perhaps chlorine. In the slower digestion method followed by drying, all biological entities are removed whether we test for them or not. Faster methods may not destroy all pathogens present. Further, in the case of chlorine, which evidently is subsequently removed, are other molecules chlorinated and then discharged with the water?

**Appendix X**

**PRESENTATION FOR PUBLIC  
INFORMATION MEETINGS/PUBLIC HEARINGS  
OCTOBER 2007**

## **SEWRPC Regional Water Quality Management Plan Update for the Greater Milwaukee Watersheds**

Presentation for  
PUBLIC INFORMATION MEETINGS/PUBLIC HEARINGS  
October 2007  
Michael G. Hahn, PE, PH  
SEWRPC Chief Environmental Engineer

## **SEWRPC Regional Water Quality Management Plan Update / MMSD 2020 Facilities Plan**

**Cooperative Intergovernmental Watershed Based Planning Program**

**Partners:**

## **REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE (RWQMPU or 208 Plan)**

- SEWRPC is State-designated and Federally-recognized areawide water quality planning agency
- RWQMPU prepared pursuant to Section 208 of the Federal Clean Water Act
- Areawide water quality planning is watershed-based
- Plan provides:
  - Recommendations to abate water pollution
  - Basis for local eligibility for Federal and State sewerage system loans and grants
  - Basis for issuance by WDNR of Wisconsin Pollutant Discharge Elimination System (WPDES) permits
  - Basis for public and private sanitary sewer extension approvals

## **REGIONAL WATER QUALITY MANAGEMENT PLANNING IN SE WISCONSIN**

- Initial 1979 Regionwide Plan
- Amended by SEWRPC Milwaukee Harbor Estuary Study in 1987
- 1995 SEWRPC Report Documented Status of Implementation of 1979 Plan
- Continuing Program is Ongoing—WDNR & SEWRPC Cooperative Program with U.S. EPA Support (sewer service areas, environmental corridor protection, etc.)
- 2003-2007 RWQMPU for Greater Milwaukee Watersheds

## ***208 Plan Objectives***

- Develop a watershed-based plan
  - Holistically address all water pollution sources
  - Cost-effectively improve water quality
  - Meet designated water use objectives and water quality standards/criteria **to the degree possible**
  - Consider alternatives to simply meeting current regulations for point source control if a greater improvement in water quality can be achieved cost-effectively

## ***SEWRPC Regional Water Quality Management Plan Update / MMSD 2020 Facilities Plan (2020 FP)***

- Parallel, coordinated planning processes
  - Both utilize the same watershed-based water quality models
  - Joint Citizens Advisory Council and Watershed Officials Forum
- SEWRPC RWQMPU also has:
  - Technical Advisory Committee
  - Modeling Subcommittee

## SEWRPC Regional Water Quality Management Plan Update

### ➤ SEWRPC is Preparing Two Reports:

- Planning Report No. 50, *A Regional Water Quality Management Plan Update for the Greater Milwaukee Watersheds*
- Technical Report No. 39, *Water Quality Conditions and Sources of Pollution in the Greater Milwaukee Watersheds*
- View preliminary draft chapters at [sewrpc.org](http://sewrpc.org) under “Water Quality Management Plan” and “Plan Chapters”

## Pollution Sources Summary

### Greater Milwaukee Watersheds Fecal Coliform Loadings

## **Conditions Simulated in Water Quality Models**

- Existing Year 2000
- Planned Year 2020

### **SCENARIOS: "BOOKEND" CONDITIONS BUILT ON THE FUTURE SITUATION**

- 1A: No Sanitary Sewer Overflows (SSO) and No Combined Sewer Overflows (CSO) with Sewer Separation in MMSD Combined Sewer Service Area (CSSA).

**CAPITAL COST=\$5.1 BILLION**

- 1B: No SSOs and No CSOs – No Sewer Separation in CSSA.

**CAPITAL COST=\$5.8 BILLION**

- 1C: No SSO with Increased Level of Protection (LOP) for CSO.

**CAPITAL COST=\$2.2 BILLION**

- 1D: No SSO based on I/I Reduction with Increased LOP for CSO.

**CAPITAL COST=\$7.7 BILLION**

- 2: High Level of Best Management Practices. **CAPITAL COST=\$2.0 BILLION**

## **CONCEPTUAL ALTERNATIVE PLANS**

- No Action – Future 2020 Condition

- Regulatory Alternatives

- B1 - Meet Point and Nonpoint Source Discharge Regulations
- B2 – Operate MMSD System to Minimize Overflows, Meet Nonpoint Source Discharge Regulations
- **BOTH HAVE CAPITAL COST OF \$2.0 BILLION**

- Watershed-Based Alternatives

- C1 – Goal is Compliance with Receiving Water Quality Standards. **CAPITAL COST OF \$2.6 BILLION**
- C2 – Goal is Compliance with Receiving Water Quality Standards Plus "Green" Components Directed Toward Water Quality Improvement. **CAPITAL COST OF \$2.2 BILLION**

## Recommended Plan Components

- Land Use Plan Element
- Surface Water Quality Element
  - Urban and rural nonpoint source pollution abatement
  - Point source pollution abatement measures in areas outside the MMSD planning area
  - Includes MMSD 2020 Facilities Plan recommendations except for increase in South Shore WWTP capacity through addition of physical-chemical treatment
  - Instream water quality measures
  - Inland lake measures
  - Auxiliary surface water quality measures
- Groundwater Management Plan Element

### Land Use Plan Element: Kinnickinnic River Watershed

- Conveyance facilities sized using year 2020 population and land use based on community-supplied information and
- MMSD regional storage and treatment facilities sized using 2020 population and land use based on 2035 regional land use plan

## Land Use Plan Element: Milwaukee River Watershed

- Conveyance facilities sized using year 2020 population and land use based on community-supplied information and
- MMSD regional storage and treatment facilities sized using 2020 population and land use based on 2035 regional land use plan

## Land Use Plan Element: Root River Watershed

## ***Land Use Plan Element***

- Preserve primary environmental corridors (PEC)
  - 85 % of PEC currently protected
    - Public interest ownership
    - State-local floodplain and shoreland-wetland zoning
    - State rules on sanitary sewer extensions
    - Local land use regulations
- Preserve natural areas and critical species habitat sites

## ***Urban and Rural Runoff Control***

- Nonpoint Source Control Component
  - Address urban and rural stormwater runoff pollution
  - Incorporate environmental restoration measures
  - Recognize Federal and State rules regarding urban and rural stormwater management

## *Rural Runoff Control Plan - Overview*

### ➤ Rural

- Realistic level of implementation of Chapter NR 151 rules
- Manure and nutrient management
- Controls on barnyard runoff
- Riparian buffers
- Wetland and prairie restoration
- Restrict livestock access to streams
- Manage milking center wastewater
- Manage private onsite waste treatment systems

## *Urban Runoff Control Plan - Overview*

### ➤ Urban

- Full implementation of Chapter NR 151 rules
- Enhanced program to detect and eliminate illicit discharges to the stormwater management system and to control urban-sourced pathogens
- Fertilizer management (low phosphorus fertilizer)
- Chloride reduction (roads and water softeners)
- Green features such as rain barrels, rain gardens, and stormwater trees
- Management of pet litter, marina waste
- Control of non-migratory waterfowl
- Litter control

## ***Point Source Pollution Abatement Measures in Areas Outside the MMSD Planning Area***

- Refinement of Sewer Service Areas
- Facilities planning: Cedarburg/Grafton, Caledonia, Fredonia, Jackson, Mt. Pleasant, Newburg, Racine, Raymond, Sturtevant, and Yorkville
- Programs similar to the Capacity Management, Operations, and Maintenance (CMOM) Program

## ***Instream Water Quality Measures***

- Consistent with flood control needs, restore or rehabilitate selected degraded stream channels
- Evaluate condition of MMSD Kinnickinnic River flushing station
- Develop dam abandonment and associated riverine area restoration plans
- Design stream crossings to allow passage of aquatic organisms
- Fisheries
  - Protect remaining natural channels
  - Minimize number of stream crossings
  - As opportunities arise, remove or retrofit obstructions to fish passage

## *Other Surface Water Quality Measures*

- Identify and address local sources of beach contamination
- Conduct household hazardous waste collection programs
- Conduct pharmaceutical and personal care product collection programs
- Identify and address exotic invasive species in lakes and riverine areas

## *Other Surface Water Quality Measures*

- Water quality monitoring recommendations:
  - Continue current MMSD, WDNR, and USGS monitoring programs
  - Continue to upgrade Citizen-based programs
  - Modify, or expand, existing programs to include monitoring on tributaries
  - Add fishery and macroinvertebrate monitoring at long-term stations
  - Add habitat monitoring stations
  - Monitoring organizations should standardize 1) quality assurance and control and 2) sampling protocols and analyses

## ***Recommended Plan***

- **Does not call for** upgrading MMSD's South Shore WWTP through provision of physical chemical treatment
  - Potential capital cost saving of \$97 to \$152 million (Might apply cost saving to additional, targeted nonpoint source controls)
- **Calls for**
  - Studies of system capacities at Jones Island and South Shore WWTPs
  - Monitoring actual population and land use changes
  - Evaluating the success of the recommended efforts to “hold the line” on I/I
  - Continued efforts to improve and refine the MMSD real-time control strategy for the deep tunnel (variable VRSSI), including the effect of upgraded pumping capacity from the tunnel to Jones Island
  - **Demonstration project for physical-chemical treatment at South Shore**
  - Continued study of blending at South Shore
- **MMSD and customer communities attempt to obtain regulatory recognition of the integrated nature of the MMSD system**
  - Possible elimination of the distinction between tunnel-related SSOs and CSOs
- **Depending on outcome of these activities, provision of additional capacity at South Shore may not be needed**

## ***Recommended Plan***

- If, in the future, results of variable VRSSI and capacity analyses, future population trends, and I/I efforts indicate that a capacity upgrade is needed at the South Shore WWTP, and physical-chemical treatment with chemical flocculation is found to be feasible:
  - Implementation of physical-chemical treatment with chemical flocculation would be recommended at South Shore

## ***Integrated Watershed-Based Recommended Plan***

- If, in the future, a capacity upgrade is needed at the South Shore WWTP, and physical-chemical treatment with chemical flocculation is found to not be feasible:
  - Blending would be recommended at South Shore

## ***Cost Analysis***

- Estimated **capital cost of new measures** recommended under the RWQMPS: **\$1.5 billion**, annual O&M cost is \$28.5 million
- Additional, estimated capital cost of associated existing, committed, and regulatory programs: \$1.2 billion, annual O&M cost is \$33.0 million. Those costs would be incurred regardless of whether full plan is implemented
- Estimated total capital cost of both components : \$2.7 billion, annual O&M cost is \$61.5 million

## Summary of Plan Costs

| Plan Category                             | Estimated Capital Cost | Average Annual Operation and Maintenance Cost |
|-------------------------------------------|------------------------|-----------------------------------------------|
| Urban runoff pollution abatement          | \$239.0 million        | \$34.7 million                                |
| Rural runoff pollution abatement          | \$244.0 million        | \$21.9 million                                |
| MMSD & member communities sewerage system | \$1,962.0 million      | \$1.5 million                                 |
| Instream measures                         | \$180.4 million        | \$0.6 million                                 |
| Other sewerage systems                    | \$70.1 million         | \$0.8 million                                 |
| Monitoring and Other                      | \$1.0 million          | \$1.9 million                                 |
| Total                                     | \$2.70 billion         | \$61.5 million                                |

Note: Of the total capital cost, **\$1.470 billion**, or **54 percent**, represent new expenditures, of the total Operation and Maintenance cost, **\$28.5 million**, or **46 percent**, represent new expenditures.

Source: MMSD, HNTB, and SEWRPC.

## Ability of Recommended Plan to Meet Water Use Objectives and Water Quality Standards

### ➤ Assessed based on:

- Water quality modeling results for pollutants for which there are regulatory or planning standards
- Modeled changes in instream pollutant concentrations under recommended conditions relative to existing and future conditions

## Conformance with Water Quality Standards at Given Locations in Streams

### ➤ Water Use Objectives

- Coldwater Biological Community (CWBC)
- Fish and Aquatic Life (FAL)
- Limited Forage Fish
- Limited Aquatic Life
- Special Variance (Fecal coliform and DO Standards)
- CWBC & Outstanding Resource Water (Dashed)
- CWBC & Exceptional Resource Water (Dashed)
- FAL & Exceptional Resource Water (Dashed)

## Water Quality Standards Compliance Under Recommended Plan Conditions: Milwaukee River Watershed

## Water Quality Standards Compliance Under Recommended Plan Conditions: Root River Watershed

## ***Implementation Plan***

- Assignment of implementation responsibilities
- Costs apportioned between public and private sectors and estimated by community
- Information on grant funding programs

## ***Implementation Plan***

- Watershed-based permit will be considered
  - Incorporate existing WPDES permits for WWTP, municipal separate storm sewer systems, and Concentrated Animal Feeding Operations (CAFOs)
  - Expanded State cost-share funding and/or water quality credit trading to provide incentives to address unpermitted agricultural/rural nonpoint sources

## ***Next Steps for the Regional Water Quality Management Plan Update***

- Completion of Technical Advisory Committee review of planning report
- Public informational meetings
- Adoption of the plan by the Regional Planning Commission – Anticipated in December 2007
- WDNR approval and Governor's certification of plan to USEPA
- USEPA approval of plan
- Endorsement of plan by counties and other local units of government

## **Amendment to SEWRPC Planning Report No. 50**

### **A REGIONAL WATER QUALITY MANAGEMENT PLAN UPDATE FOR THE GREATER MILWAUKEE WATERSHEDS**

**May 2013**

#### **BACKGROUND ON THIS PLAN AMENDMENT**

This amendment presents revisions to SEWRPC Planning Report No. 50 (PR No. 50)<sup>1</sup> based on changes to the watershed water quality models necessitated by findings during additional modeling efforts conducted after the plan report was issued. Those modeling efforts were conducted under a separate study directed toward evaluating the possible effects of climate change on water quality in the streams of the study area.

In this plan amendment document:

- New text providing background and explanations of the reasons why this plan amendment report was prepared and notes in the text indicating the location of revised sections of PR No. 50 are indicated with yellow highlighting,
- Revisions to text originally presented in PR No. 50 and subsequently revised for the reasons described below are indicated with blue highlighting, and
- Original text from PR No. 50 that is unchanged, but is provided in this plan amendment report to provide context for associated report changes, is unhighlighted.

#### **REASONS FOR THIS PLAN AMENDMENT**

In 2011, the Southeastern Wisconsin Regional Planning Commission staff, with funding from the National Oceanic and Atmospheric Administration (NOAA) Sectoral Applications Research Program (SARP), and working collaboratively with the University of Wisconsin-Milwaukee (UW-M) School of Freshwater Sciences Great Lakes WATER Institute, the UW-M Department of Civil Engineering and Mechanics, the University of Wisconsin-Madison Nelson Institute for Environmental Studies Center for Climatic Research (CCR), and Tetra Tech, Inc., began a study to evaluate the possible effects of climate change on water quality in the greater Milwaukee watersheds. That study was designed to apply statistically downscaled meteorological data representing best and worst case climate change conditions as determined from general circulation models developed by several climatology laboratories using a standard set of greenhouse gas emission scenarios developed by the Intergovernmental Panel on Climate Change. Time series reflecting climate change were developed by the Nelson Institute CCR for precipitation and air temperature, and potential evapotranspiration time series were recomputed using the parameters described in Chapter V, "Water Resource Simulation Models and Analytic Methods," of SEWRPC PR No. 50. The precipitation, air temperature, and potential evapotranspiration time series reflecting best and worst case climate change conditions were input to the calibrated and validated U.S. Environmental Protection Agency HSPF continuous simulation water quality models of the Kinnickinnic, Menomonee, Milwaukee, and Root River watersheds, and the Oak Creek watershed that were developed in conjunction with the planning effort documented in SEWRPC PR No. 50.

---

<sup>1</sup>SEWRPC Planning Report No. 50, A Regional Water Quality Management Plan Update for the Greater Milwaukee Watersheds, Parts 1 and 2, December 2007.

Tetra Tech performed the watershed water quality modeling under the regional water quality management plan update for the greater Milwaukee watersheds documented in PR No. 50, and they also did the modeling for the NOAA SARP study. In the course of doing the NOAA SARP modeling, Tetra Tech discovered an error in the HSPF input files that affected the summation and reporting of total nitrogen (TN) and total phosphorus (TP) at some water quality assessment locations in the Kinnickinnic, Menomonee, and Root River watersheds and the Oak Creek watershed (see Attachment A).<sup>2,3</sup> The Tetra Tech memorandum notes that “[t]he error was a result of an improper conversion factor applied to the inorganic fraction of N and P when calculating sums of TN and TP.” The Milwaukee River LSPC watershed continuous simulation model and the Lake Michigan Direct Drainage area model, and the water quality results from those models, were not affected by the error.

It is important to note that the error did not represent a fundamental problem with the watershed water quality models in that it only affected how total nitrogen and total phosphorus concentrations were summarized at certain instream locations, and it did not affect:

- Model calibration/validation<sup>4</sup>
- Any load predictions
- Boundary conditions to the estuary model
- Internal calculations, and any reported results for nutrient species
- Instream statistical measures for:
  - o Fecal coliform bacteria
  - o Dissolved oxygen (DO)
  - o Biochemical oxygen demand (BOD)
  - o Copper
  - o Total suspended sediment (TSS)

Tetra Tech revised the continuous simulation models for the Kinnickinnic, Menomonee, and Root River watersheds and the Oak Creek watershed.<sup>5</sup>

---

<sup>2</sup>Tetra Tech Memorandum, Nutrient Output for Milwaukee HSPF Models (Revised), March 13, 2012.

<sup>3</sup>Specifically, only mean and median TN and TP concentrations and the percent of time that TP exceeds the 0.1 mg/L planning standard applied under the RWQMPSU were affected at assessment locations other than those locations where water quality monitoring data were available.

<sup>4</sup>Instream concentrations of TN and TP computed at the assessment points representing calibration/validation monitoring stations were not affected by the error.

<sup>5</sup>That revision also corrected a relatively minor error that affected total nitrogen concentrations at some instream assessment points. When calibrating and validating the models, nitrite was not modeled because the total nitrogen concentrations reported at instream water quality monitoring stations did not include nitrite. However, when subsequent model analyses were made for existing year 2000 conditions, original and revised 2020 baseline conditions, scenarios, alternatives, the recommended plan, and the extreme measures condition, the modelers did not include nitrite in the calculation of total nitrogen. In general, the inclusion of nitrite in the computation of mean and median total nitrogen concentrations resulted in relatively small (3 percent or less) increases in total nitrogen concentrations. The exception was at assessment point OK-10 in the lower Oak Creek watershed where concentration increases were 9 percent or less.

The parts of SEWRPC PR No. 50 that were affected by the revisions include:<sup>6</sup>

- The “Comparison of Alternative Plans” subsection on pages 482 through 484 of the report,
- Figures 67 and 68, each entitled “Achievement of Recommended Total Phosphorus Planning Standard,” on pages 615 and 616,
- The portion of the “Evaluation of Water Quality Modeling Analysis Results Relative to the Adopted Water Use Objectives and Water Quality Standards/Criteria,” subsection related to total phosphorus on pages 617, 621, and 622 of the report,
- Appendix J, “Comparison of Water Quality Summary Statistics for Alternative Water Quality Management Plans,”
- Appendix K, “Water Quality Standard Compliance Summary Statistics for Alternative Water Quality Management Plans,” and
- Appendix N, “Water Quality Summary Statistics for the Recommended Plan.”

The revised sections and subsections, or portions thereof, of SEWRPC PR No. 50, Part 1, including text, tables, and figures, and the revised Appendices J, K, and N from SEWRPC PR No. 50, Part 2 are presented below. Within a report section or subsection, the revised text and figures are excerpted and some preceding and following text is included to provide proper context for the changed portions. For the three appendices, the entire revised appendix is presented.<sup>7</sup>

---

<sup>6</sup>As noted above, the NOAA SARP study utilized the RWQMPU continuous simulation watershed water quality models. The model error described previously was discovered during conduct of that study, was corrected, and did not adversely affect the results of that study. In addition, MMSD was conducting a third-party total maximum daily load study of the Kinnickinnic, Menomonee, and Milwaukee River watersheds at the time that the error was discovered. That study also applied the RWQMPU water quality models. The error was discovered prior to execution of those models under the TMDL study, and appropriate model revisions were made to ensure that the TMDL study results were correct.

<sup>7</sup>The regional water quality management plan update for the greater Milwaukee watersheds (PR No. 50, RWQMPU) was published prior to revisions to Wisconsin’s water quality standards for total phosphorus becoming effective on December 1, 2010. In the absence of a State water quality criterion for total phosphorus at the time of publication, a planning standard of 0.1 mg/l was adopted for the RWQMPU. For consistency with the RWQMPU approach, this amendment document also applies a total phosphorus planning standard of 0.1 mg/l to all streams and rivers evaluated. The revisions to the State phosphorus water quality standards are reflected in Chapters NR 102, “Water Quality Standards for Wisconsin Surface Waters,” and NR 217 “Effluent Standards and Limitations for Phosphorus,” of the Wisconsin Administrative Code. Section NR 102.06(3)(a) establishes a total phosphorus water quality criterion of 0.100 mg/l for designated rivers, Section NR 102.06(3)(b) calls for most other “surface waters generally exhibiting unidirectional flow” to meet a total phosphorus criterion of 0.075 mg/l, and Section NR 102.06(5)(b) calls for the nearshore waters of Lake Michigan to meet a total phosphorus criterion of 0.007 mg/l. Within the greater Milwaukee watersheds, the river reaches that are assigned a total phosphorus criterion of 0.100 mg/l are the Kinnickinnic River from its confluence with Wilson Park Creek to the Milwaukee River, the Menomonee River from its confluence with the Little Menomonee River to the Milwaukee River, and the Milwaukee River from its confluence with Cedar Creek downstream through the Milwaukee Harbor estuary and the outer harbor. Thus, in those three river reaches, the planning standard applied under the RWQMPU and herein are equivalent. In other stream reaches evaluated herein, the planning standard of 0.1 mg/l is one-third greater than the current State criterion of 0.075 mg/l.

[NOTE: The following section is a revised version of the text on pages 480 to 484 in Chapter IX, “Development of Alternative Plans: Description and Evaluation,” of PR No. 50.]

## COMPARATIVE EVALUATION OF WATER QUALITY MANAGEMENT ALTERNATIVE PLANS

The preceding section of this chapter describes water quality management plan alternatives for the greater Milwaukee watersheds. This section compares the major features of those alternative plans, including economic considerations and water quality benefits. The following evaluation and comparison serves as the basis for the development of the preliminary recommended water quality management plan.

### **Pollutant Loading Analysis**

Tabular comparisons of the various point and nonpoint source pollutant loadings for the alternative water quality management plans are presented in Appendix B. Also shown for comparative purposes are loads based on existing land use with current wastewater conveyance, storage, and treatment systems in place.

The information presented in Appendix B shows that the expected pollutant loadings under Alternative A, the future year 2020 baseline condition, are generally similar to existing conditions. The largest loading differences are in fecal coliform bacteria, which are anticipated to drop by about 21 percent relative to existing conditions, and total suspended solids, which are anticipated to increase by about 10 percent relative to existing conditions. The other indicator pollutants listed show modest differences of  $\pm 3$  percent relative to existing conditions. Although there is more development under the future condition, and thus more potential for pollutant loads, this is offset by construction of the additional committed MMSD and community facilities and implementation of the Chapter NR 151 nonpoint source pollution control rules, all of which are assumed under the future condition.

Among the remaining water quality management plan alternatives, Alternatives B1 and B2 provide similar results to one another. The major difference is in the allocation of fecal coliform point source loadings between SSOs and CSOs. Alternative B2, which calls for a change in operating procedure for the ISS, shows a lower loading from CSOs than Alternative B1, but a higher loading from SSOs. Overall, the total combined CSO and SSO fecal coliform bacteria load is higher under Alternative B2 than for Alternative B1. For the other pollutants listed, the difference between these two alternatives is negligible.

In terms of overall pollutant load reduction, Alternative C1 provides results that are similar to Alternatives B1 and B2. Alternative C2, which includes the highest level of nonpoint source controls, provides the highest overall level of pollutant load reduction among the alternative plans. For all of the alternative plans, the highest percent reductions occur for total suspended solids and fecal coliform bacteria, while the lowest percent reductions occur for total nitrogen and copper.

### **Water Quality Conditions and Ability to Meet Water Use Objectives**

The water quality benefits of the alternative plans were evaluated by comparing the effects of the plan alternatives, as predicted using the mathematical simulation modeling techniques described in Chapter V of this report, upon a number of water quality indicators. Tabular comparisons of water quality conditions among alternative plans are presented in Appendix J (revised). In general, the anticipated differences in water quality conditions among alternatives are small.

### ***Methodology for Comparing Alternative Plans***

The effects of the alternative plans on water quality indicators were compared at 64 water quality assessment points. The locations of these assessment points are shown on Maps 57 through 62. Many of the assessment points also correspond with the location of MMSD water quality sampling sites. A cross-reference between the assessment point designations shown on the maps and the MMSD sampling site designations is provided in Table 75. A series of comparisons were made at each site using 20 indicators related to concentrations of the following six water quality parameters: fecal coliform bacteria, dissolved oxygen, total phosphorus, total nitrogen, total suspended solids, and copper. These indicators are listed in Table 77. A variety of indicators were compared for these parameters. For all six parameters, comparisons were made among the arithmetic mean concentrations predicted for each alternative plan. Similarly, comparisons were made among the median concentrations predicted for each alternative plan for all parameters except fecal coliform bacteria, where the geometric mean

Table 77

## WATER QUALITY INDICATORS USED TO COMPARE ALTERNATIVE PLANS

| Parameter                                     | Indicator                                                                                                |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------|
| Fecal Coliform Bacteria over Entire Year      | Arithmetic mean concentration of fecal coliform bacteria                                                 |
|                                               | Proportion of time fecal coliform bacteria concentration is equal to or below single sample standard     |
|                                               | Geometric mean concentration of fecal coliform bacteria                                                  |
|                                               | Days per year geometric mean of fecal coliform bacteria is equal to or below geometric mean standard     |
| Fecal Coliform Bacteria from May to September | Arithmetic mean concentration of fecal coliform bacteria                                                 |
|                                               | Proportion of time fecal coliform bacteria concentration is equal to or below single sample standard     |
|                                               | Geometric mean concentration of fecal coliform bacteria                                                  |
|                                               | Days per year geometric mean of fecal coliform bacteria is equal to or below geometric mean standard     |
| Dissolved Oxygen                              | Mean concentration of dissolved oxygen                                                                   |
|                                               | Median concentration of dissolved oxygen                                                                 |
|                                               | Proportion of time dissolved oxygen concentration is equal to or above applicable standard               |
| Total Phosphorus                              | Mean concentration of total phosphorus                                                                   |
|                                               | Median concentration of total phosphorus                                                                 |
|                                               | Proportion of time total phosphorus concentration is equal to or below the recommended planning standard |
| Total Nitrogen                                | Mean concentration of total nitrogen                                                                     |
|                                               | Median concentration of total nitrogen                                                                   |
| Total Suspended Solids                        | Mean concentration of total suspended solids                                                             |
|                                               | Median concentration of total suspended solids                                                           |
| Copper                                        | Mean concentration of copper                                                                             |
|                                               | Median concentration of copper                                                                           |

Source: SEWRPC.

concentrations were applied. For those water quality parameters for which there are regulatory or planning water quality criteria and standards (see Chapter VII of this report), comparisons were also made of the proportion of time that the parameter would be in compliance with the criteria and standards.<sup>14</sup> Where special use or variance waters were identified, the applicable standards were used. All comparisons involving fecal coliform bacteria were performed both on a full-year basis and for the May to September period when the potential for body contact would be greater.

For each indicator at each assessment point, the four alternative plans other than the future baseline condition (Alternative A) were compared to one another. Alternative A was not included in the comparison since it served as the basis of the remaining four alternatives, and, thus, should always reflect the worst water quality conditions

<sup>14</sup>The proportion of time in compliance estimates are based on the results of the water quality model simulation that utilized a 10-year simulation period.

among all of the alternative plans. The comparison among the remaining four alternatives was made by computing the relative deviation of the value of the indicator associated with that alternative plan from the mean value of the indicator for all four alternatives. This was computed by subtracting the mean value of the indicator for all alternatives at a given site from the value of the indicator for the alternative and dividing the result by the mean value that was subtracted. The sign of the relative deviation was adjusted for some indicators so that a positive relative deviation indicated better water quality and a negative relative deviation indicated poorer water quality.<sup>15</sup> For each water quality parameter, the relative deviations from all indicators were totaled. Subtotals were also computed for each watershed. An overall score was computed by totaling the scores from each water quality parameter. Prior to totaling, the scores were adjusted to give each water quality parameter equal weight in the overall total.<sup>16</sup>

It is worth commenting on two properties of this method. First, this method compares the effects of alternative plans relative to one another. A higher value in the final total for an alternative plan indicates better water quality relative to the other alternative plans. Similarly, a lower value in the final total for an alternative plan indicates poorer water quality relative to the other alternatives. It is important to note that because only the alternative plans were included in this analysis, a negative value in the final total does not indicate poorer water quality than existing or future baseline conditions. Second, because greater differences among alternative plans in the values of indicators result in larger relative deviations, greater differences in the final totals for alternative plans indicate greater differences in overall effects on water quality conditions. Conversely, similar final totals for two alternatives indicate that their overall effects on water quality conditions are not very different.

### ***Comparison of Alternative Plans***

Watershed totals and overall totals for relative deviations of water quality indicators from mean values are shown in Table 78. This analysis indicates that the greatest overall water quality benefit is provided by Alternative C2. This alternative is followed, in decreasing order of the benefit provided, by Alternative C1, Alternative B2, and Alternative B1. In most watersheds, the relative effects of the alternative plans follow this overall pattern.

There are **four** important exceptions to this generalization. First, the differences in total relative deviations between Alternative B1 and Alternative B2 in the Menomonee River, Milwaukee River, and Oak Creek watersheds are small, suggesting that there is little difference between the overall water quality resulting from these two alternatives in these watersheds. Second, there is no difference in the total relative deviations between Alternative C1 and C2 in the Kinnickinnic River watershed, suggesting that there is little difference in overall water quality resulting from these two alternatives in this watershed. Third, in the Kinnickinnic River watershed,

---

<sup>15</sup>Because the methodology for assessing relative water quality conditions among alternatives was based on combining relative deviations computed for given indicators that are characteristic of given pollutants, it was necessary that the sign of the relative deviation relate to differences in water quality in a consistent manner. In cases where a lower concentration indicated better water quality, the sign of the relative deviation of a better than average alternative would be computed to be negative. In contrast, in cases where a higher concentration indicated better water quality the sign of the relative deviation of a better than average alternative would be computed to be positive. Therefore, to facilitate combining relative deviations in a manner that would properly represent relative water quality conditions, the sign of the relative deviation was reversed for those indicators for which a lower concentration indicated better water quality. This enabled the relative deviations from different indicators to be combined into a single index for which a larger positive value indicated better relative water quality.

<sup>16</sup>This unweighting was necessary because different numbers of indicators were used to characterize different water quality parameters. For example, eight indicators were used to characterize fecal coliform bacteria. By contrast, total phosphorus was characterized by three indicators. Thus, to ensure that each water quality parameter had equal influence when the relative deviations were totaled, the sum of the relative deviations for the eight fecal coliform indicators was divided by eight and the sum of the relative deviations for total phosphorus was divided by three.

Table 78 (revised)

**SUMMED RELATIVE DEVIATIONS OF WATER QUALITY INDICATORS FROM  
THE AVERAGE VALUE FOR ALTERNATIVE PLANS B1, B2, C1, AND C2**

| Plan<br>Alternative | Watershed             |                    |                    |              |               |                               | Total  |
|---------------------|-----------------------|--------------------|--------------------|--------------|---------------|-------------------------------|--------|
|                     | Kinnickinnic<br>River | Menomonee<br>River | Milwaukee<br>River | Oak<br>Creek | Root<br>River | Lake<br>Michigan <sup>a</sup> |        |
| B1                  | -0.367                | -0.666             | -0.131             | -0.738       | -0.721        | -1.377                        | -4.001 |
| B2                  | -0.400                | -0.664             | -0.131             | -0.738       | -1.156        | -0.027                        | -3.116 |
| C1                  | 0.384                 | 0.418              | -0.597             | 0.727        | -0.173        | 0.437                         | 1.195  |

<sup>a</sup>Lake Michigan assessment points include sites in the Milwaukee Harbor estuary, outer harbor, and nearshore Lake Michigan areas.

Source: SEWRPC.

Alternative B1 provides slightly greater water quality benefits than Alternative B2. This difference from the overall result is driven by lower arithmetic and geometric mean concentrations of fecal coliform bacteria and slightly lower mean concentrations of total nitrogen and mean **and median** concentrations of total phosphorus for Alternative B1 at some assessment points along the mainstem of the Kinnickinnic River. **Fourth**, in the Milwaukee River watershed, Alternatives B1 and B2 provide greater water quality benefit than Alternative C1. These differences from the overall result are driven by Alternatives B1 and B2 resulting in lower mean concentrations of total phosphorus and total nitrogen and higher percent of compliance with the standard for total phosphorus than Alternative C1 at some assessment points.

The compliance with applicable regulatory or planning water quality standards and criteria for fecal coliform bacteria, dissolved oxygen, and total phosphorus expected under the four alternative plans are summarized in Appendix K **(revised)**. In general, only small differences in compliance with water quality standards were noted among the alternative plans.

Quantitative analyses of the water quality conditions expected to be achieved under the four alternative plans indicated that violations of the applicable regulatory standards for fecal coliform bacteria may be expected to occur in the Kinnickinnic, Menomonee, Milwaukee, and Root Rivers and Oak Creek under each alternative plan. The frequency of these violations is expected to range from occasional to frequent, with chronic violations expected to occur at a few assessment points in upstream areas of the Milwaukee River. By contrast, substantial achievement of applicable standards for fecal coliform bacteria is expected under each alternative plan at most assessment points in the estuary, outer harbor, and nearshore Lake Michigan areas.<sup>17</sup> At most assessment points, the expected level of compliance with applicable standards for fecal coliform bacteria is slightly higher during the May to September swimming season than during the entire year. While differences in the expected levels of compliance among alternative plans are small, Alternative C2 provides the highest level of compliance with water quality standards for fecal coliform bacteria followed by Alternative C1, Alternative B2, and Alternative B1.

Quantitative analyses of the water quality conditions expected to be achieved under the four alternative plans indicated that each alternative would allow for substantial achievement of the applicable regulatory dissolved oxygen standards in the Kinnickinnic River, Menomonee River, Milwaukee River, Root River, estuary, outer harbor, and nearshore Lake Michigan areas. The analyses also indicate that each alternative would allow for substantial achievement of the dissolved oxygen standard for fish and aquatic life in the downstream reaches of Oak Creek. Violations of the dissolved oxygen standard for fish and aquatic life would be expected to occur occasionally to frequently in the upstream reaches of Oak Creek. The analyses indicated that there are few

<sup>17</sup>In the outer harbor and nearshore Lake Michigan area, the full recreational use fecal coliform standards of a geometric mean concentration of 200 counts per 100 ml and a maximum single sample concentration of 400 counts per 100 ml were used to evaluate compliance.

differences among alternatives in the expected level of compliance with applicable dissolved oxygen standards. At assessment points where differences are expected, these differences are small.

Quantitative analyses of the water quality conditions expected to be achieved under the four alternative plans indicated that violations of the recommended planning standard for total phosphorus may be expected to occur in the Kinnickinnic, Menomonee, Milwaukee, and Root Rivers; Oak Creek; and the estuary under each alternative plan. The frequency of these violations is expected to range from occasional to frequent, with total phosphorus exceeding the recommended concentration the majority of the time at all assessment points in the Kinnickinnic River watershed and most in the Milwaukee River watershed, but generally not exceeding the planning standard the majority of the time in the other watersheds. While differences in the expected levels of compliance among alternative plans are small, Alternative C1 provides the highest level of compliance with the recommended planning water quality standard for total phosphorus, followed by Alternative C2, and then by Alternatives B2, and B1, which would generally be expected to achieve the same level of compliance.

[NOTE: Figures 67 and 68 and the following text are revised versions of information set forth in Chapter X, “Recommended Water Quality Management Plan,” of PR No. 50 in the section titled “Ability of the Recommended Water Quality Management Plan to Meet Adopted Objectives and Standards.” The following figures and text revise information set forth on pages 615 to 622.]

- **Wetland/Prairie Restoration:** Increase conversion of cropland and pasture to prairie from the recommended 5 percent to 10 percent and increase conversion of cropland and pasture to wetland from the recommended 5 percent to 10 percent.
- **Septic System Management:** Increase reduction in fecal coliform bacteria from systems installed prior to 1980 from 10 percent under the recommended plan to 50 percent.
- **Fertilizer Management:** A 10 percent reduction in the phosphorus load from lawns was assumed under the recommended plan. The extreme measures condition applies targeted reductions of 50 percent from lawns in the Kinnickinnic, Menomonee, and Milwaukee River watersheds and 15 percent in the Oak Creek and Root River watersheds.
- **Phosphorus in Industrial Noncontact Cooling Water:** Assume that there is no significant phosphorus load to streams from noncontact cooling water discharges.

***Evaluation of Water Quality Modeling Analysis Results Relative to the Adopted Water Use Objectives and Water Quality Standards/Criteria***

Water quality summary statistics for 106 water quality assessment points distributed along streams throughout the 1,127-square mile study area and in the nearshore area of Lake Michigan are set forth by watershed in Tables N-1 through N-6. Mean and median concentrations are set forth for the 10-year simulation period. For pollutants that have regulatory or planning standards, the percent of time is indicated that a given stream or Lake assessment point is in compliance with the applicable standard. Geometric means are presented for fecal coliform bacteria for comparison with regulatory standards.

The following general conclusions can be drawn from review of the data presented in Tables N-1 through N-6:

- **Fecal Coliform Bacteria**
  - Marked reductions in concentration may be achieved under recommended plan conditions.
  - Improvements in compliance with the applicable standards are not as pronounced because of the existing high concentrations.
- **Dissolved Oxygen**
  - Compliance with the applicable standards is generally good under existing conditions.
  - Little change is projected to occur under the other conditions analyzed.
- **Total Phosphorus**
  - The most significant reductions in concentration generally occur under revised 2020 baseline conditions relative to existing conditions, except in stream reaches where discharges of noncontact cooling water are significant. In reaches where there are substantive noncontact cooling water discharges, the most significant total phosphorus reductions occur under the “extreme measures” condition.
  - The reductions under revised 2020 baseline conditions relative to existing conditions may be attributable to the effects of implementation of NR 151 stormwater runoff controls and construction of MMSD committed projects.
  - Increases in concentrations are projected to occur at some locations in the upper Menomonee River watershed and the Milwaukee River watershed under revised 2020 baseline conditions. Relatively small increases in concentrations could occur at three locations in the Outer Harbor and two in the nearshore Lake Michigan area.
  - The recommended plan is projected to produce marked reductions in concentrations relative to revised 2020 baseline conditions in the Lake Michigan inner and outer harbor areas.
  - Under the extreme measures condition marked reductions in concentrations relative to recommended plan conditions could occur in the Lake Michigan inner and outer harbor areas and at some locations in the Kinnickinnic and Menomonee River watersheds, particularly in reaches with significant noncontact cooling water discharges.
- **Total Nitrogen**
  - In the Kinnickinnic River, Menomonee River, and Oak Creek watersheds and the upper portion of the Root River watershed where urban land use predominates, the most significant reductions in concentrations occur under revised 2020 baseline conditions relative to existing conditions.
  - In the Milwaukee River watershed, the most significant reductions in concentrations occur under recommended plan conditions relative to the revised 2020 baseline conditions.
  - In the Root River Canal subwatershed and the lower Root River watershed downstream of the confluence with the Root River Canal, significant reductions in concentrations occur under both revised 2020 baseline conditions relative to existing conditions and recommended plan conditions relative to the revised 2020 baseline conditions.

- In the Lake Michigan inner and outer harbor, significant reductions in concentrations occur both under revised 2020 baseline conditions relative to existing conditions and under recommended plan conditions relative to revised 2020 baseline conditions.
- In the nearshore Lake Michigan area little change in concentrations would be expected among the five conditions considered.
- **Total Suspended Solids**
  - In the Kinnickinnic River, Menomonee River, and Oak Creek watersheds, the most significant reductions in concentrations occur under revised 2020 baseline conditions relative to existing conditions.
  - These reductions may be attributable to the effects of implementation of NR 151 stormwater runoff controls and completion of MMSD committed projects.
  - In the Milwaukee River watershed, the greatest reductions in concentrations occur under recommended plan conditions relative to revised 2020 baseline conditions.
  - In the urban areas of the Root River watershed in Milwaukee County, significant reductions in concentrations are anticipated under revised 2020 baseline conditions relative to existing conditions.
  - In the remainder of the Root River watershed and in the Lake Michigan inner and outer harbor areas, reductions in concentrations would be anticipated to occur both under revised 2020 baseline conditions relative to existing conditions and under recommended plan conditions relative to revised 2020 baseline conditions.
- **Copper**
  - In the Kinnickinnic River, Menomonee River, Oak Creek, and Root River watersheds and in the Lake Michigan inner and outer harbor areas, the most significant reductions in concentrations generally occur under the revised 2020 baseline conditions relative to existing conditions.
  - In most locations in the Milwaukee River watershed and the nearshore Lake Michigan area no significant changes in concentrations would be expected among the five conditions considered.

#### *Compliance with Adopted Water Quality Standards*

For purposes of assessing compliance with water quality standards under this regional water quality management plan update, it was assumed that a stream reach would meet the water quality standard and attain its designated use objective if the modeled water quality results indicate compliance with the standard at least 85 percent of the time.

The data on compliance with standards as set forth in Tables N-1 through N-6 are summarized in Figures 57 through 68. For a given pollutant and standard, a pair of figures indicate the degree of compliance with applicable standards among the existing, revised 2020 baseline, recommended plan, and extreme measures conditions for each watershed in the study area, the Milwaukee harbor estuary, the outer harbor, and the nearshore Lake Michigan area. The first figure in each pair presents a set of three graphical comparisons. These comparisons consist of:

- The percentage of assessment points achieving or exceeding 85 percent compliance with the standard over the 10-year water quality simulation period,
- The percentage of assessment points achieving or exceeding 70 to 84 percent compliance with the standard over the 10-year simulation period, and
- The percentage of assessment points achieving less than 70 percent compliance with the standard over the 10-year simulation period.

Thus, for the four conditions represented, these graphs facilitate determination of the degree to which 1) a water quality standard is complied with in a given watershed (defined as compliance 85 percent of the time or greater), 2) a standard is close to being complied with (compliance 70 to 84 percent of the time), and 3) a standard is unlikely to be complied with (compliance less than 70 percent of the time). The second figure in each pair presents a pair of graphical comparisons of cumulative levels of compliance for each of the conditions indicated above. The two graphical comparisons consist of:

- The percentage of assessment points achieving or exceeding 85 percent compliance with the standard over the 10-year water quality simulation period.
- The percentage of assessment points achieving or exceeding 70 percent compliance with the standard over the 10-year water quality simulation period.

The assessments in Figures 57 through 68 are evaluated below.

- **Figures 57 and 58: Achievement of the Single Sample Fecal Coliform Bacteria Standard Assessed on an Annual Basis**

Compliance with this standard 85 percent of the time would not be expected under existing, revised 2020 baseline, or recommended plan conditions at the assessment points in the Kinnickinnic River, Menomonee River, Oak Creek, or Root River watersheds. In the Kinnickinnic River watershed, 30 percent or less of the assessment points would be expected to achieve compliance 85 percent of the time under the extreme measures condition. In the Menomonee River, Oak Creek and Root River watersheds, none of the assessment points would be expected to achieve 85 percent compliance even under the extreme measures condition. In the Milwaukee River watershed less than 10 percent of the assessment points would be expected to achieve 85 percent compliance, or better, under all four conditions.

In the Milwaukee outer harbor and nearshore Lake Michigan area, compliance with standards was evaluated through comparison of modeled water quality results with the standards for the fish and aquatic life water use objective with full recreational use. In the Harbor estuary, compliance with the standard would be expected 85 percent of the time or more at more than 80 percent of the assessment points under the revised 2020 baseline, recommended plan, and extreme measures conditions. In the Outer harbor and nearshore Lake Michigan area 85 percent compliance with the standard would be expected at all locations.

Substantial proportions of the total numbers of assessment points in the Kinnickinnic and Menomonee River watersheds, and to a lesser degree the Root River watershed, would be expected to achieve compliance in the 70 to 84 percent range. Large proportions of the total numbers of assessment points in the Milwaukee River, Oak Creek, and Root River watersheds, would be expected to achieve compliance less than 70 percent of the time.

**Overall, in all riverine reaches, a low degree of compliance with this standard would be expected under all conditions considered. However, a high degree of compliance would be expected in the estuary, outer harbor, and nearshore Lake Michigan area.**

- **Figures 59 and 60: Achievement of the Geometric Mean Fecal Coliform Bacteria Standard Assessed on an Annual Basis**

Compliance with this standard 85 percent of the time would not be expected at a large number of assessment points in any of the watersheds under the four conditions analyzed, although, somewhat greater compliance would be expected under the extreme measures condition in the Kinnickinnic River watershed. That indicates that, if expenditures on additional point source controls could be foregone as might be possible under the recommended plan, additional resources directed toward control of nonpoint source pollution could achieve measurable improvements in water quality in that watershed.

In the Oak Creek and Root River watersheds, none of the assessment points would be expected to achieve compliance 85 percent of the time under any of the four conditions. With the exceptions of the Kinnickinnic River watershed under the extreme measures conditions only, compliance with this standard would be expected less than 70 percent of the time at a large proportion of the assessment points in all of the watersheds. In the estuary, the majority of assessment points would be expected to achieve 85 percent compliance, or better, under the revised 2020 baseline, recommended plan, and extreme measures conditions. All assessment points in the outer harbor and nearshore Lake Michigan area would be expected to achieve at least 85 percent compliance under all four conditions.

**Overall, in all riverine reaches, a low degree of compliance with this standard would be expected under all conditions considered. However, a relatively high degree of compliance would be expected in the estuary and a high degree of compliance would be expected in the outer harbor, and nearshore Lake Michigan area.**

- **Figures 61 and 62: Achievement of the Single Sample Fecal Coliform Bacteria Standard Assessed on a May to September Basis**

In comparison to the previously-evaluated single sample standard assessed on an annual basis, much better compliance with this standard would be expected at assessment points in the Kinnickinnic and Menomonee River watersheds, and somewhat better compliance would be expected in the Milwaukee River watershed where implementation of the recommended plan would be expected to achieve a significant improvement relative to the revised 2020 baseline condition. For all four cases in the Root River watershed, 10 percent or fewer of the assessment points would be expected to achieve compliance 85 percent, or more, of the time. In the Oak Creek watershed, none of the assessment points would be expected to achieve compliance 85 percent of the time under any conditions except the extreme measures case, when about 10 percent of the assessment points would achieve 85 percent compliance. In the estuary, all assessment points would be expected to achieve 85 percent compliance, or better, under the revised 2020 baseline, recommended plan, and extreme measures conditions. In the outer harbor, and nearshore Lake Michigan area, all assessment points would be expected to achieve 85 percent compliance, or better, under all four conditions.

**Overall, a relatively high degree of compliance with this standard would be expected in the Kinnickinnic and Menomonee River watersheds under the recommended plan and extreme measures conditions. In comparison to the single sample standard assessed on an annual basis that was evaluated above, assessment points in the Milwaukee and Root River watersheds would achieve higher levels of compliance with the standard under the recommended plan and extreme measures conditions, although those levels fall well short of what would be considered substantial compliance. Once again, the Oak Creek watershed would not be expected to achieve compliance 85 percent of the time under any conditions analyzed, except at 10 percent of the sites under the extreme measures condition. A high degree of compliance would be expected in the estuary, outer harbor, and nearshore Lake Michigan area under all conditions considered.**

- **Figures 63 and 64: Achievement of the Geometric Mean Fecal Coliform Bacteria Standard Assessed on a May to September Basis**

In comparison to the previously-evaluated geometric mean standard assessed on an annual basis, much better compliance with this standard would be expected in the Kinnickinnic and Menomonee River watersheds, and somewhat better compliance would be expected in the Milwaukee River watershed. In the Menomonee and Milwaukee River watersheds, implementation of the recommended plan would be expected to result in improved water quality relative to the revised 2020 baseline condition. While not quite as pronounced as for the geometric mean standard assessed on an annual basis, for this condition there are still large percentages of assessment points in the Kinnickinnic River, Menomonee River, Milwaukee River, Root River, and Oak Creek watersheds that would be expected to achieve less than 70 percent compliance with the standard under recommended plan conditions. In the estuary, outer harbor, and nearshore Lake Michigan area, all assessment points would be expected to achieve 85 percent compliance, or better, under all four conditions.

Overall, a relatively high degree of compliance with this standard would be expected at assessment points in the Kinnickinnic River watershed under the extreme measures condition and in the Menomonee River watershed under the recommended plan and extreme measures conditions. In comparison to the geometric mean standard assessed on an annual basis that was evaluated above, assessment points in the Milwaukee and Root River watersheds would be expected to achieve higher levels of compliance with the standard under the recommended plan and extreme measures conditions, although those levels fall well short of what would be considered substantial compliance. No assessment points in the Oak Creek watershed achieve compliance 85 percent of the time except under the extreme measures condition where 30 percent of the points would be expected to achieve compliance. A high degree of compliance would be expected in the estuary, outer harbor, and nearshore Lake Michigan area under all conditions considered.

- **Figures 65 and 66: Achievement of the Dissolved Oxygen Standard**

In general, 85 percent compliance with this standard, or better, would be expected under existing, revised 2020 baseline, recommended plan, and extreme measures conditions at the assessment points in the Menomonee, Milwaukee, and Root River watersheds, as well as the estuary, outer harbor, and nearshore Lake Michigan area. A somewhat lesser, but relatively high, degree of compliance would be expected in the Kinnickinnic River watershed, and a lower level of compliance would be anticipated in the Oak Creek watershed. However, at the assessment points in the Kinnickinnic River and Oak Creek watersheds, general compliance with the standard would be expected 70 percent or more of the time. Many of the assessment points in the Oak Creek watershed that are in the 70 to 84 percent of time compliance range fall in the higher end of that range.

Overall, a high degree of compliance with this standard would be expected under all conditions considered. As noted above, compliance within the Oak Creek watershed is somewhat better than indicated by Figure 65, because, although significant percentages of the Oak Creek watershed assessment points fall in the 70 to 84 percent of time compliance range, many of the points fall in the higher end of that range.

- **Figures 67 and 68: Achievement of the Recommended Total Phosphorus Planning Standard**

Compliance with the planning standard would be expected eighty-five percent of the time or more at:

- About 10 percent of the assessment points in the Kinnickinnic River watershed for the existing, revised 2020 baseline, and recommended plan conditions, and about 50 percent of the points under the extreme measures condition;
- Fifteen to 20 percent of the assessment points in the Menomonee River watershed for the existing, revised 2020 baseline, and recommended plan conditions, and about 25 percent of the points under the extreme measures condition;
- Twenty-five percent of the assessment points in the Milwaukee River for the existing and revised 2020 baseline conditions, and at about 40 percent of the points under the recommended plan and extreme measures conditions;
- No assessment points in the Oak Creek watershed. (However, the Oak Creek watershed is the only one where all of the assessment points would be expected to meet the planning standard 70 percent, or more, of the time.); and
- Five percent of the assessment points in the Root River watershed under all four conditions.

In the estuary, over 80 percent of the assessment points would be expected to achieve compliance with the planning standard 85 percent of the time or more under existing and revised 2020 baseline

conditions. All assessment points would be expected to achieve 85 percent compliance, or better, under the recommended plan and extreme measures conditions. All assessment points in the outer harbor and nearshore Lake Michigan area would be expected to achieve at least 85 percent compliance under all four conditions.

**Overall, with respect to the 85 percent of time bench mark, a relatively low degree of compliance with this standard would be expected in all of the watersheds under all four conditions. The assessment points in the Oak Creek watershed would be expected to achieve compliance with the planning standard more than 70 percent of the time for all four conditions. About half of the points in the Milwaukee River watershed and 60 to 70 percent of those in the Root River watershed would be expected to comply with the planning standard 70 percent or more of the time under all four conditions. About 30 percent of the assessment points in the Kinnickinnic River watershed would be expected to comply with the planning standard 70 percent or more of the time under the existing, revised 2020 baseline, and recommended plan conditions, and 80 percent of the points would comply 70 percent or more of the time under the extreme measures condition. About 50 to 55 percent of the assessment points in the Menomonee River watershed would be expected to comply with the planning standard 70 percent or more of the time under the existing, revised 2020 baseline, and recommended plan conditions, and about 90 percent of the points would comply 70 percent or more of the time under the extreme measures condition. A high degree of compliance with the planning standard would be expected in the estuary, outer harbor, and nearshore Lake Michigan area.**

*Comparison of Water Quality Conditions: Revised 2020 Baseline vs. Revised 2020 Baseline with Five-Year Level of Protection Against SSOs from MMSD System*

The water quality assessment points in, or downstream from, the MMSD planning area that are indicated on Maps N-1 through N-6 are the only assessment points that could be affected by SSOs from the MMSD system. Outside of those locations, there is no difference in the water quality statistics between the revised 2020 baseline condition and the revised 2020 baseline with a five-year level of protection (LOP) against SSOs from the MMSD system. Comparison of the water quality conditions tabulated in Appendix N (revised) with and without the five-year LOP (at those locations where there could be SSOs from the MMSD system) indicates no significant difference in water quality under the two conditions. That conclusion supports the observation that has been stated previously in this report that further reductions in point sources of pollution would be expected to have no significant effects on water quality.

**Proj. No.** 100-CLE-T27944

---

### 1 Nutrient Output Processing Error

---

While post-processing results for the Milwaukee Climate Change Risk Modeling Project, we discovered an error in the HSPF input files that affected the summation and reporting of total nitrogen (TN) and total phosphorus (TP) used in the development of the RWQMPSU. The error *did not* involve the parameterization or water quality calibration of the models, but it did affect reported output for TN and TP from the second-tier set of assessment points, specifically for concentration-based statistical measures.

The models simulate ammonia-N, nitrate-N, nitrite-N, organic-N, orthophosphate-P, and organic-P individually and were calibrated for these nutrient species. The error was a result of an improper conversion factor applied to the inorganic fraction of N and P when calculating sums for TN and TP. The lines in the UCI model files containing the improper factor were added following the calibration of the models to provide text file output of simulation results for assessment points not covered by water quality calibration sites. Assessment results coincident with the calibration sites had output stored in the project WDMs, and these locations had the proper factors. Text file output was used to prevent the model WDM from becoming overly large.

It is important to distinguish what *was* and *was not* affected in the results:

#### Not Affected

- The Milwaukee River model
- Model calibration/validation
- All load predictions
- Boundary conditions to the estuary model
- Direct drainage areas
- Internal calculations, and any reported results for nutrient species
- Statistical measures for

- Fecal coliform bacteria
- Dissolved oxygen
- BOD
- Metals
- Sediment
- Statistical measures for TN and TP reported at the initial set of analysis locations (co-located with calibration monitoring stations)

Affected

- Kinnickinnic River, Menomonee River, Oak Creek, and Root River models only
- TN and TP statistical measures for assessment points other than those at monitoring stations, for:
  - Mean and median TN and TP
  - Percent of time TP exceeds the 0.1 mg/L criterion

Specific stations affected are listed below.

| Watershed  | PR-50 Map ID # | Model Reach |
|------------|----------------|-------------|
| Root River | RT-5           | 620         |
| Root River | RT-6           | 817         |
| Root River | RT-7           | 819         |
| Root River | RT-8           | 850         |
| Root River | RT-9           | 837         |
| Root River | RT-11          | 866         |
| Root River | RT-12          | 870         |
| Root River | RT-13          | 883         |
| Root River | RT-14          | 856         |
| Root River | RT-15          | 860         |
| Root River | RT-16          | 897         |

| Kinnickinnic | KK-8           | 818         |
| Menomonee    | MN-1           | 6           |
| Menomonee    | MN-2           | 803         |
| Menomonee    | MN-3           | 812         |
| Menomonee    | MN-4           | 820         |
| Menomonee    | MN-6           | 834         |
| Menomonee    | MN-7           | 841         |
| Menomonee    | MN-8           | 855         |
| Menomonee    | MN-10          | 861         |
| Menomonee    | MN-11          | 871         |
| Menomonee    | MN-13          | 890         |
| Menomonee    | MN-14          | 905         |
| Menomonee    | MN-15          | 883         |
| Menomonee    | MN-16          | 914         |

The conversion factor for translating fecal coliform from mass count to concentration ( $8.107\text{E-}8$ ) was used in place of the factor for lb/ac-ft to mg/L (0.368). This was applied to inorganic species in the summation of TN and TP only. As a result, the concentration in the model text output files essentially represents the organic fraction of TN and TP, which is an underestimate.

## 2 Impacts of the Error

The influence on results is variable, depending largely on the relative contribution of the inorganic fraction to the total value. Assessment points downstream of point sources with high output of inorganic nutrient mass are the most affected, since the reporting error reflected conditions in the reach. In addition, our comparisons to date have been conducted only for the climate scenario results, which (with the exception of Oak Creek) used altered meteorological inputs. Even so, a before-and-after comparison of underreported versus corrected results provides an indication of the discrepancy. Two examples are shown here. The first shows typical changes; mean TP is about 57 percent high, and mean TN is about 100 percent higher. Most stations appear to follow this pattern within a range of +/- 30 percent. The degree of change in TP percent compliance is more variable, depending heavily on how close the mean is to 0.1 mg/L. Example B shows the location with the largest change, in a small channel downstream of GE and several smaller industrial discharges. The difference is much larger (on the order of a 300 percent increase for TP), and TP percent compliance drops to a single digit once the inorganic component of TP from the discharges in this effluent-dominated watercourse is included in the accounting.

### Example A – Typical Difference (OK-2: North Branch of Oak Creek)

| Parameter        | Measure                                     | Original | Corrected |
|------------------|---------------------------------------------|----------|-----------|
| Total Phosphorus | Mean (mg/l)                                 | 0.0457   | 0.0721    |
|                  | Median (mg/l)                               | 0.0243   | 0.0298    |
|                  | Percent compliance with 0.1 mg/l standard   | 88       | 80        |
|                  | Percent compliance with 0.075 mg/l standard | 83       | 76        |
| Total Nitrogen   | Mean (mg/l)                                 | 0.45     | 0.91      |
|                  | Median (mg/l)                               | 0.41     | 0.8       |

### Example B – Large Difference (KK-2: S. 43rd Street Ditch)

| Parameter        | Measure                                     | Original | Corrected |
|------------------|---------------------------------------------|----------|-----------|
| Total Phosphorus | Mean (mg/l)                                 | 0.0834   | 0.3303    |
|                  | Median (mg/l)                               | 0.0721   | 0.3179    |
|                  | Percent compliance with 0.1 mg/l standard   | 85       | 2         |
|                  | Percent compliance with 0.075 mg/l standard | 65       | 1         |
| Total Nitrogen   | Mean (mg/l)                                 | 0.77     | 1.55      |
|                  | Median (mg/l)                               | 0.75     | 1.54      |

### 3 Fixing the Error in the UCI Files

As noted above, the error only affects the additional reporting stations. Within the NETWORK block there is a separate section for each new station. Each of these follows a consistent format and is labeled as "new station", as in the following example from the Kinnickinnic model (highlights added), except that the RCHRES, PLGTEN, COPY, and GENER numbers will change.

```

NETWORK

COPY 94 OUTPUT MEAN 1 PLGTEN 80 INPUT MEAN 1

```

The error occurs in the multiplication factors column – specifically in the second and third non-blank multipliers, which respectively point (in this case) to PLGTEN 93 and 94. The PLOTINFO block shows that these PLGTENs are associated with file numbers 93 and 94, and that these in turn are the output for TN and TP. Specifically, the lines in question are routing (1) the concentration calculated from the sum of inorganic N storages (from NUST 1, NUST 2, and NUST 3) and (2) the concentration calculated from the PO<sub>4</sub> storage (from NUST 4) to the concentration summations for TN and TP. The lines should occur in the same order in each new station output block.

The conversion factor is to convert mass (or bacterial number) divided by volume (in AF) to concentration. The factor 8.107E-8 is the appropriate factor for producing fecal coliform concentrations in #/100 ml, and properly occurs twice in the block. The correct factor for converting mass (lbs) divided by volume (AF) to concentration in mg/L is 0.368. Each “new station” section within the NETWORK block should thus be corrected as follows:

```

*** new station 1
